Probing Neutrino Dipole Portal with Supernovae

Wednesday 15 May 2024 16:15 (15 minutes)

Sterile neutrinos constitute one of the simplest solutions to explain the origin of neutrino masses. They can be easily produced in the hot and dense core of a core-collapse supernova (SN). Firstly, I'll revisit the SN1987A cooling bounds for dipole portal using the integrated luminosity method, which yields more reliable results than emissivity loss criterion. I'll then discuss a novel bound on the sterile neutrino parameter space arising from the energy deposition and the observed population of underluminous SN-IIP.

Mini Symposia (Invited Talks Only)

Author: CHAUHAN, Garv (Virginia Tech)

Co-authors: SHOEMAKER, Ian (Virginia Tech); HUBER, Patrick; HORIUCHI, Shunsaku (Virginia Tech)

Presenter: CHAUHAN, Garv (Virginia Tech)

Session Classification: Astro-particle Physics

Track Classification: Astro-particle Physics
