ARCANE Reweighting: A Solution to the Negative Weights Problem in Collider Monte Carlo

Monday 13 May 2024 16:00 (15 minutes)

In this talk, I will introduce ARCANE reweighting, a new Monte Carlo technique to solve the negative weights problem in collider event generation. We will see a demonstration of the technique in the generation of $(e^+e^- \longrightarrow q\bar{q} + 1 \text{ jet})$ events under the MC@NLO formalism.

In this scenario, ARCANE can reduce the fraction of negative weights by redistributing the contributions of \mathbb{H} - and \mathbb{S} -type events a) without introducing any biases in the distribution of physical observables and b) without requiring any changes to the matching and merging prescriptions used.

I believe that the technique can be applied to other processes of interest like $(q\bar{q} \longrightarrow W + \text{jets})$ and $(q\bar{q} \longrightarrow t\bar{t} + \text{jets})$ as well.

Mini Symposia (Invited Talks Only)
