(Received 4 March 2016; published 19 May 2016)*

We consider the possibility that the black-hole (BH) binary detected by LIGO may be a signature of dark matter. Interestingly enough, there remains a window for masses $20M_{\odot} \lesssim M_{\text{bh}} \lesssim 100M_{\odot}$ where primordial black holes (PBHs) may constitute the dark matter. If two BHs in a galactic halo pass sufficiently close, they radiate enough energy in gravitational waves to become gravitationally bound. The bound BHs will rapidly spiral inward due to the emission of gravitational radiation and ultimately will merge. Uncertainties in the rate for such events arise from our imprecise knowledge of the phase-space structure of galactic halos on the smallest scales. Still, reasonable estimates span a range that overlaps the $2\text{--}53 \text{ Gpc}^{-3} \text{ yr}^{-1}$ rate estimated from GW150914, thus raising the possibility that LIGO has detected PBH dark matter. PBH mergers are likely to be distributed spatially more like dark matter than luminous matter and have neither optical nor neutrino counterparts. They may be distinguished from mergers of BHs from more traditional astrophysical sources through the observed mass spectrum, their high ellipticities, or their stochastic gravitational wave background. Next-generation experiments will be invaluable in performing these tests.

Primordial Black Holes as Dark Matter

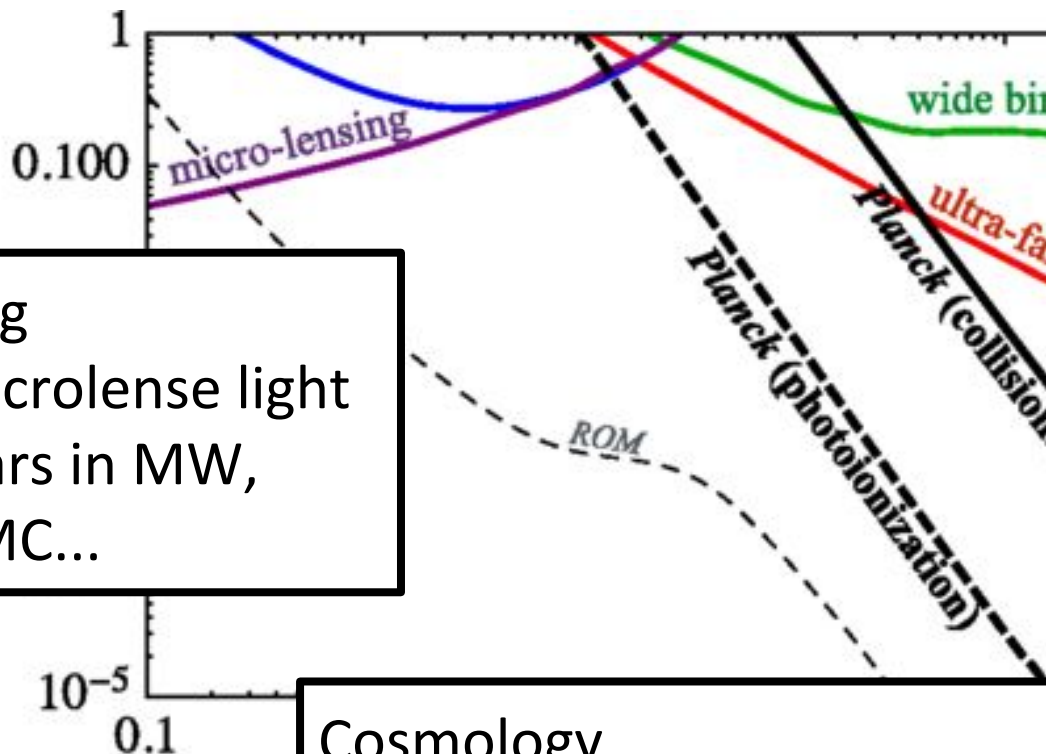

Constraints on PBH Mass

PRD 95, 043534 (2017)

Primordial Black Holes as Dark Matter

Constraints on PBH Mass

Dynamics

- PBHs disrupt existing wide binaries
- PBHs affect dynamics of stars in dwarfs

Microlensing

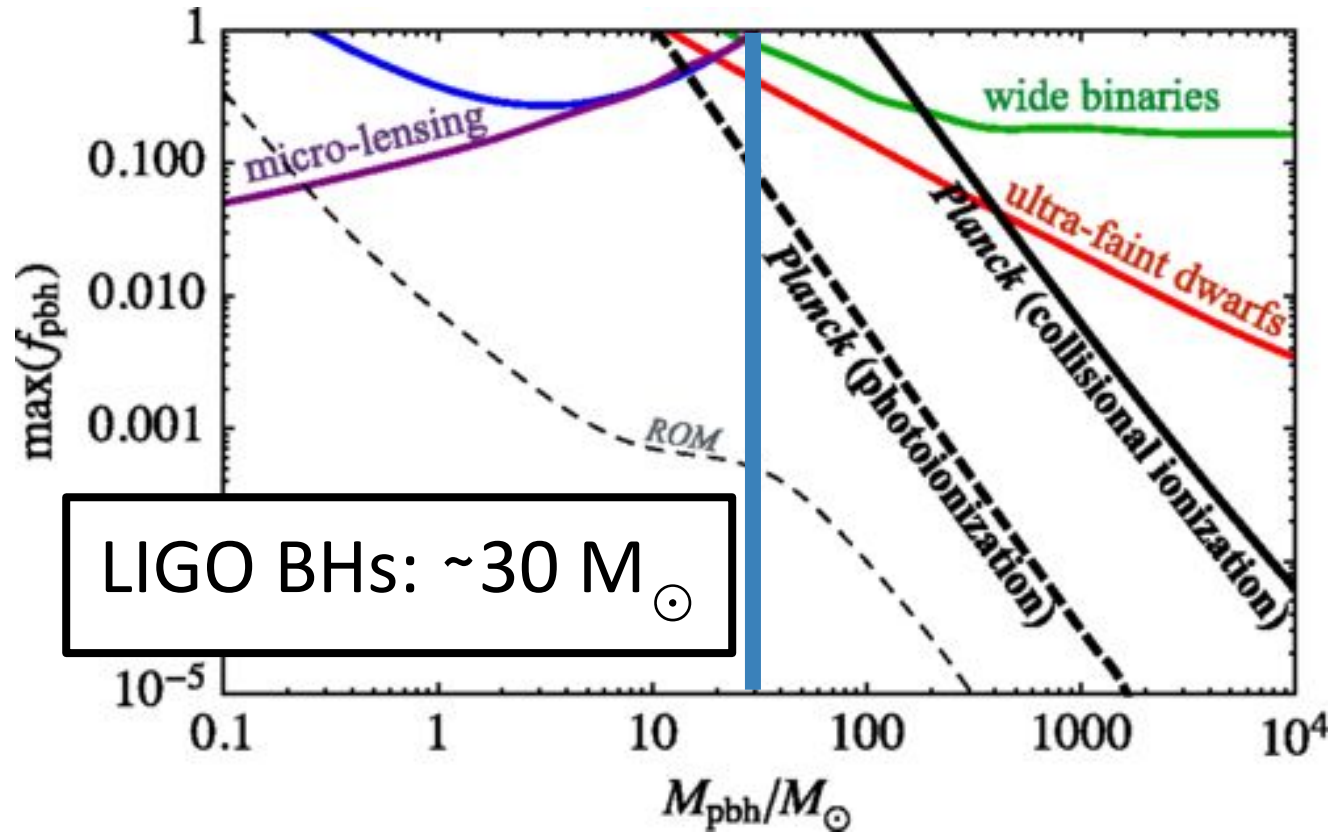

- PBHs microlense light from stars in MW, LMC, SMC...

Cosmology

- PBHs in early universe heat up environment via accretion + radiation, changing the CMB

Primordial Black Holes as Dark Matter

Constraints on PBH Mass

Primordial Black Holes in the Milky Way

If PBHs are DM:

- MW halo contains $10^{11} - 30 M_{\odot}$ PBHs
 - 10^9 in the bulge

Can this many objects
hide in the Milky Way?

The physics of accreting black holes

What we know about **astrophysical** black holes:

- They accrete gas, launch jets, and radiate X-ray and radio emission

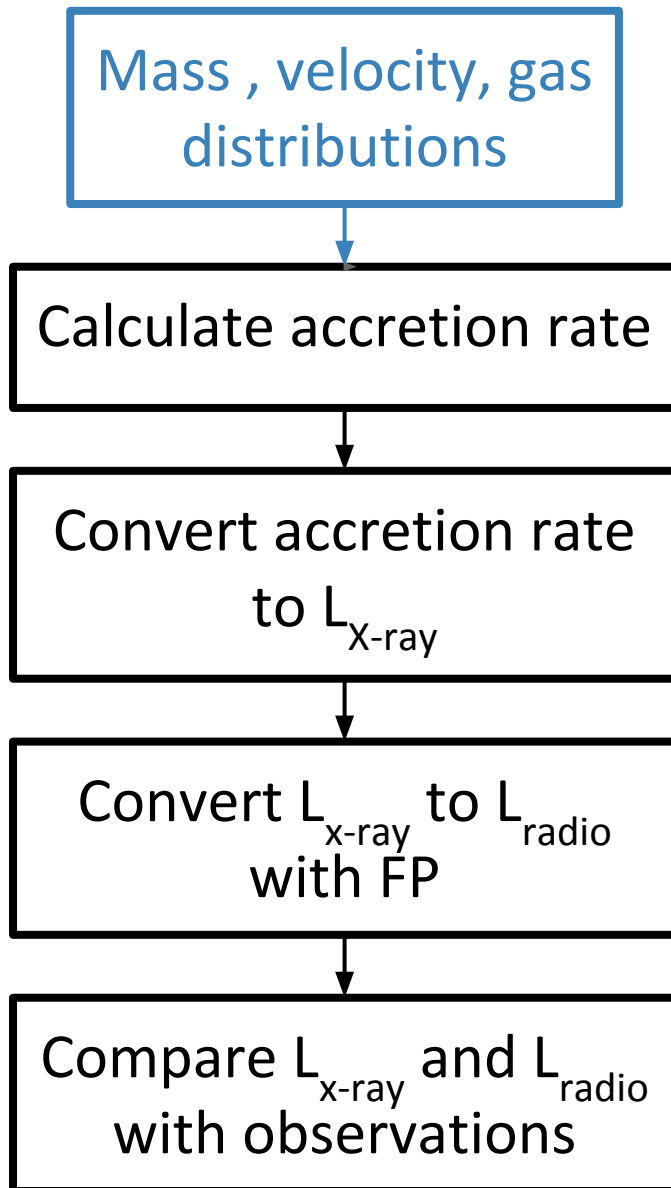

MNRAS 419:267 (2012)

Fundamental Plane for BHs with jets:

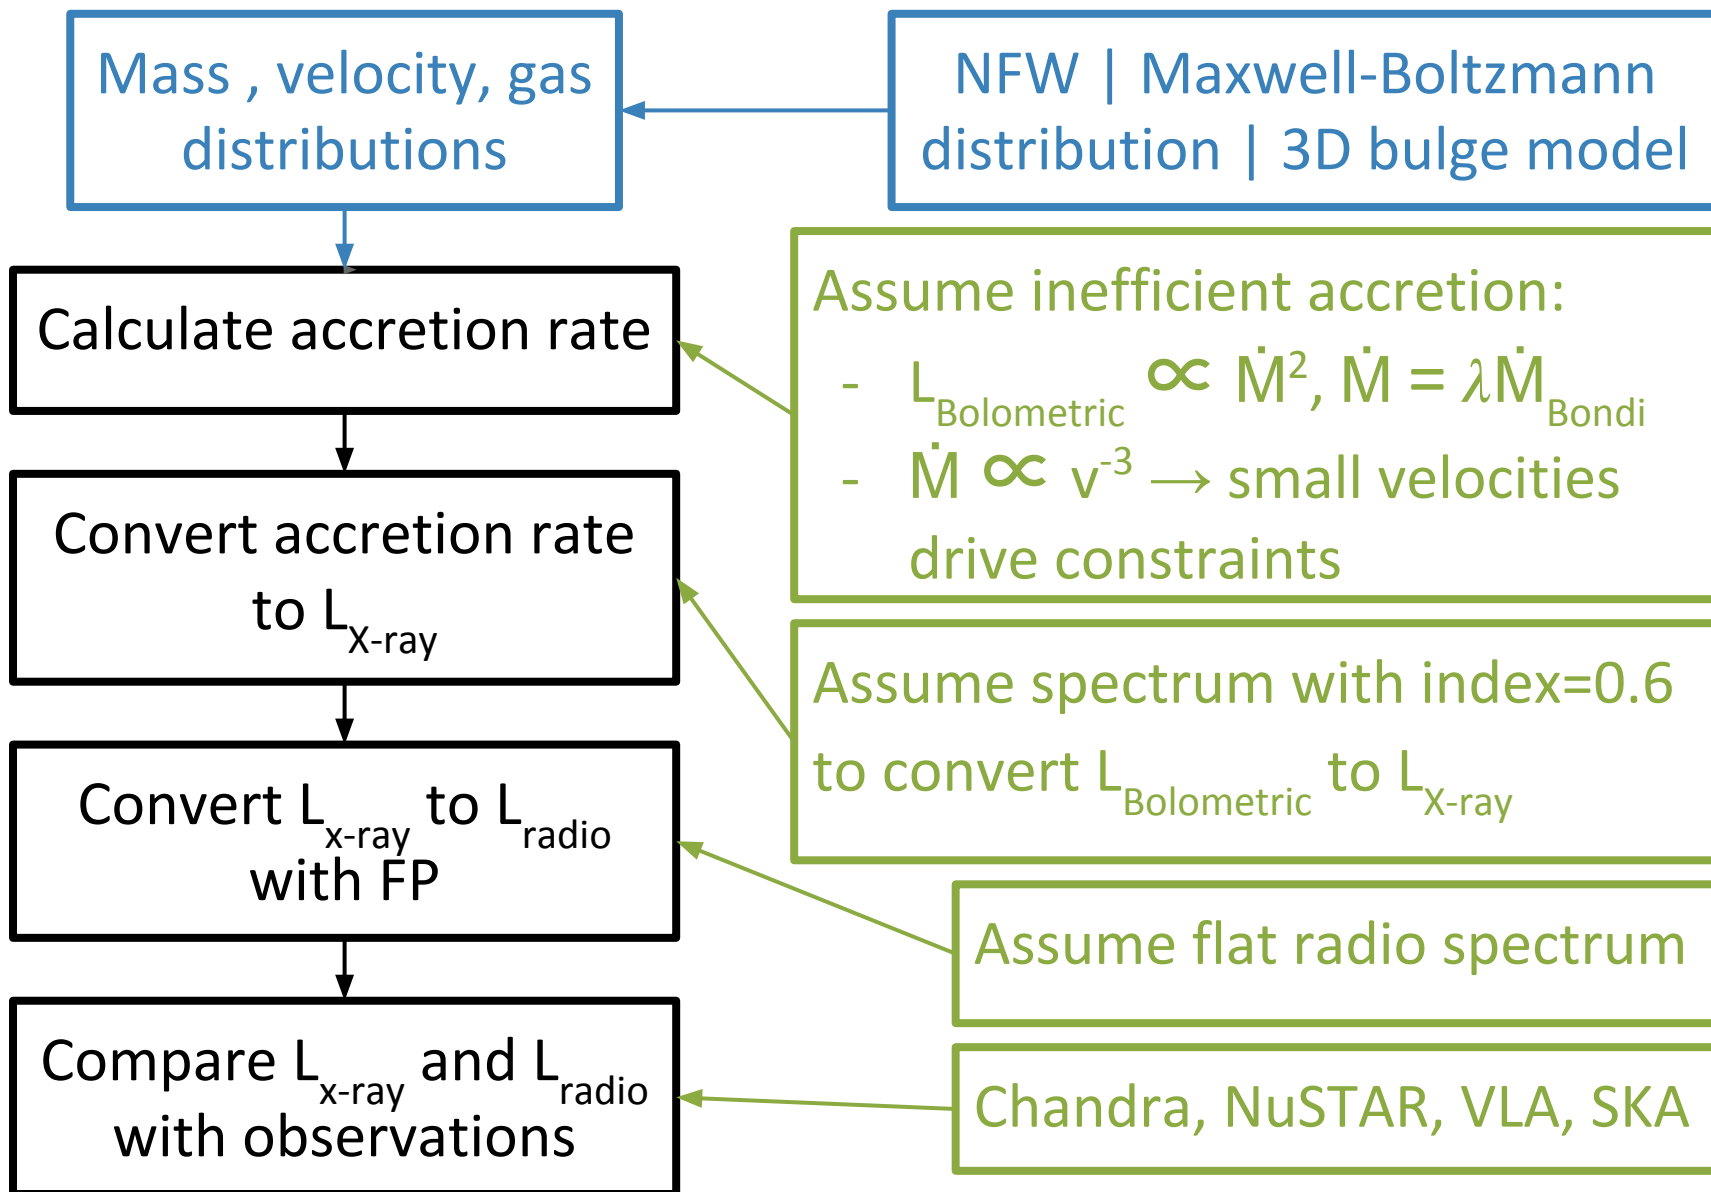

- Mass of BH
- Radio Luminosity
- X-ray Luminosity

PBHs in the Milky Way: the plan

Flow chart inspired by Fig 1
in MNRAS 430:3 (2013)

PBHs in the Milky Way: the plan

PBHs in the Milky Way: Observations

Chandra (0.5-8 keV)

$L > 4e32$ erg/s :

- 500 (likely Galactic) sources detected
- All 500 are candidate PBHs
- 2500 ± 50 PBHs detectable in ROI

→ $f_{\text{DM}} = 1$ excluded at 40σ

ApJSS 181:110 (2009)

PBHs in the Milky Way: Observations

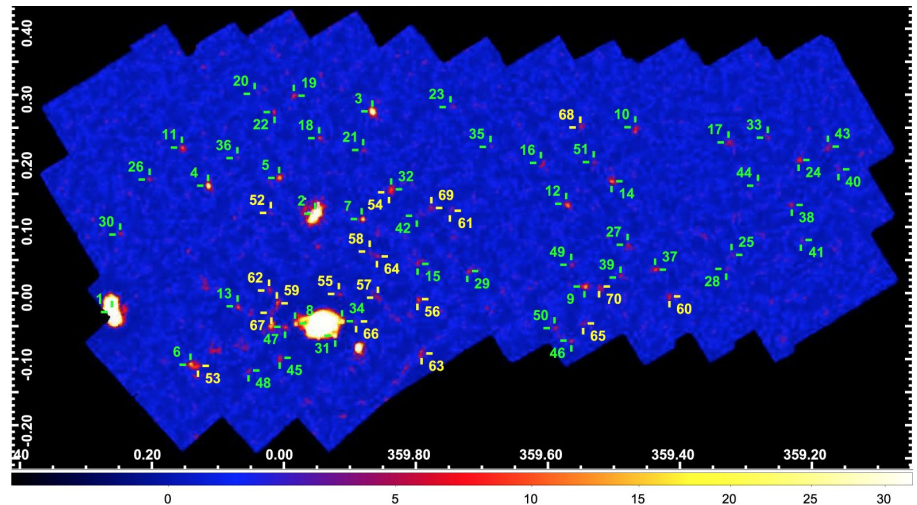

NuSTAR (10-40 keV)

$L > 8e32$ erg/s:

- 70 sources detected
- 30 candidate PBHs
- 160 ± 12 PBHs

detectable in ROI

→ $f_{\text{DM}} = 1$ excluded at 10σ

ApJ 825:132 (2016)

PBHs in the Milky Way: Observations

VLA (1.4 GHz)

flux > 1 mJy:

- 170 detected sources
- 0 candidate PBHs
(from FP + Chandra)
- 40 ± 6 PBHs
detectable in ROI

→ $f_{\text{DM}} = 1$ excluded at
 6σ

ApJSS 174:481 (2008)

PBHs in the Milky Way: Constraints

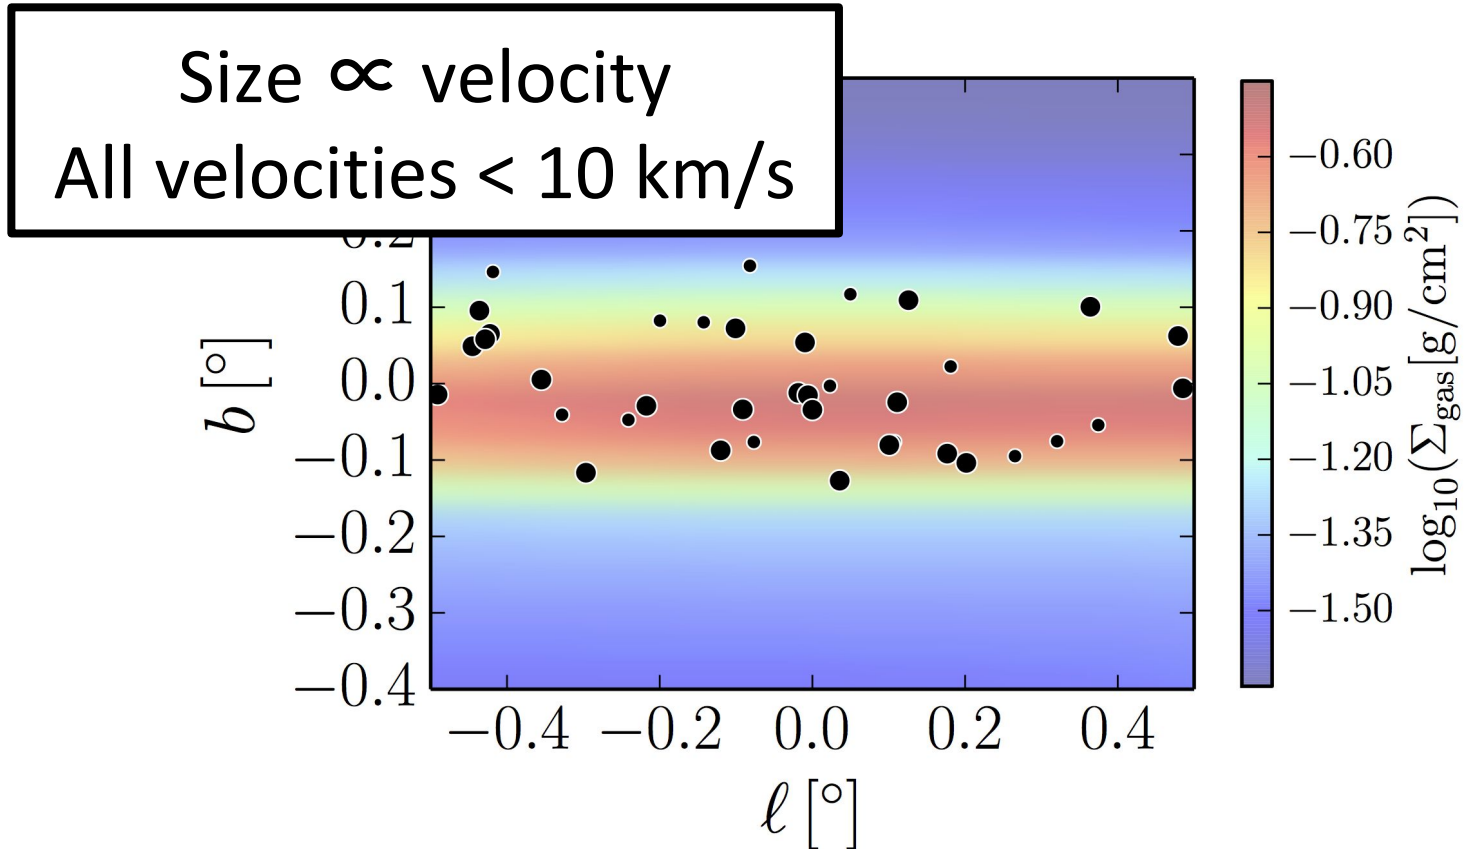

PBHs in the Milky Way: Radio Results

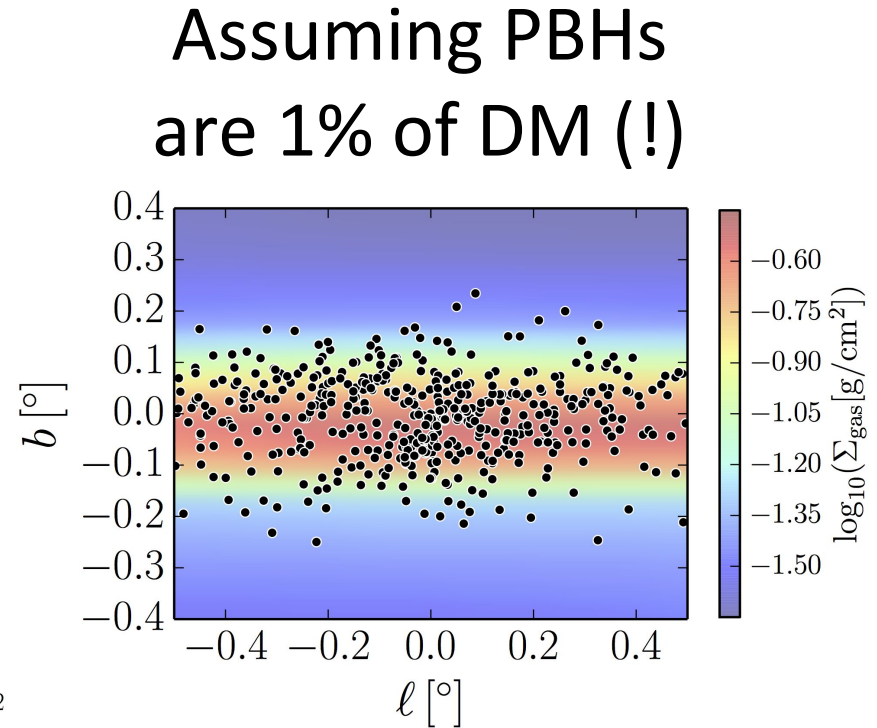

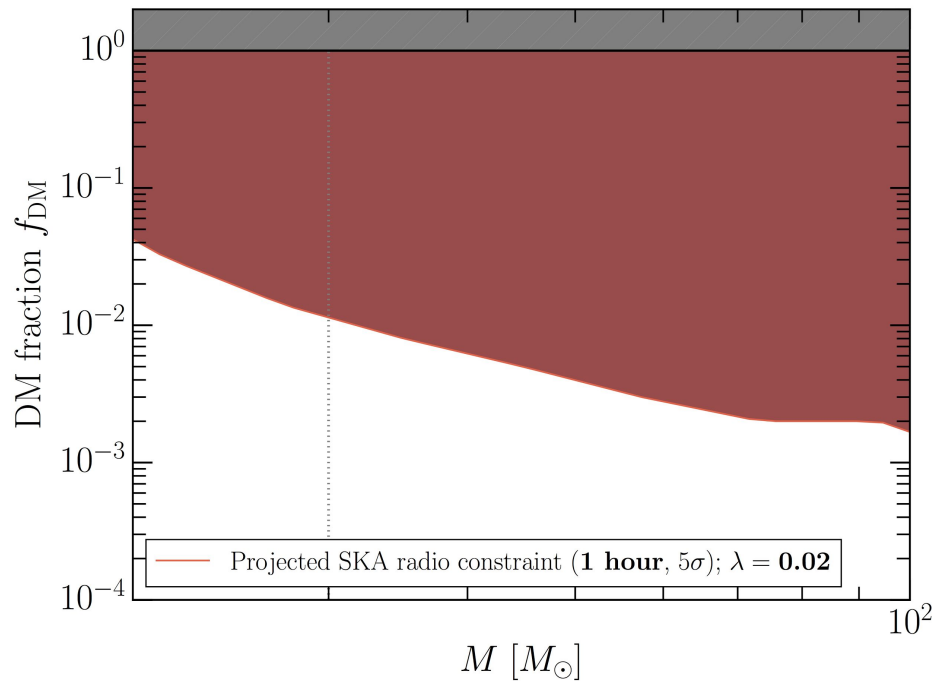

40 \pm 6 PBHs detectable with VLA

PBHs in the Milky Way: Radio Results

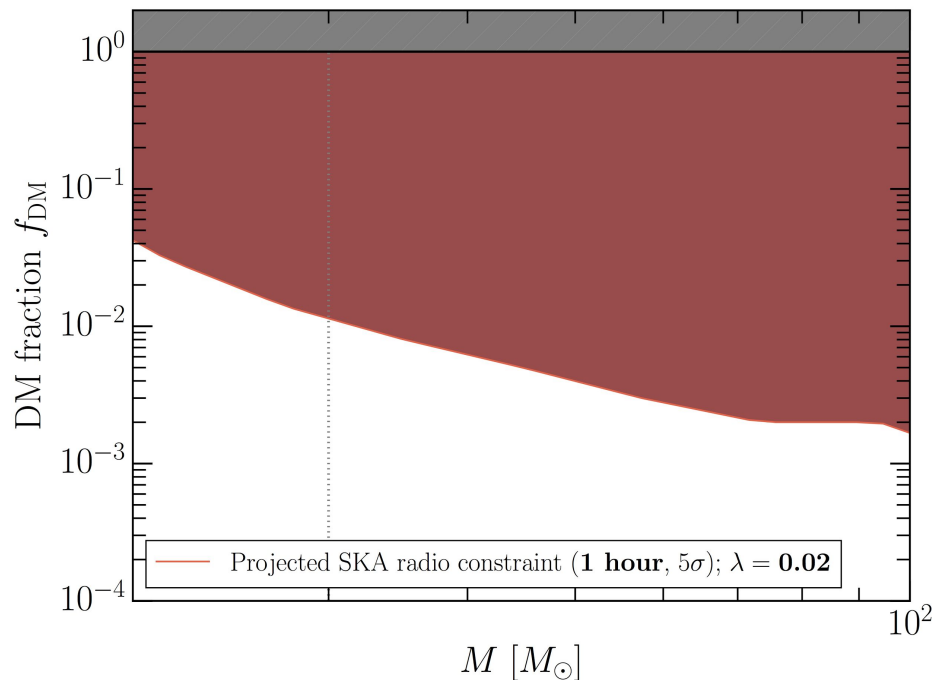

40 ± 6 PBHs detectable with VLA

PBHs in the Milky Way: SKA predictions

PBHs in the Milky Way: SKA predictions

Assuming PBHs
are 1% of DM (!)

SKA will detect (or rule out) this population!

Searching for PBHs in Radio + X-ray

Can we hide a population of PBHs in the Milky Way? **NO**

Searching for PBHs in Radio + X-ray

Can we hide a population of PBHs in the Milky Way? **NO**

Constraints complement previous bounds, totally different method

SKA will detect (or rule out) this population!

Primordial Black Holes in the Milky Way

Inefficient Accretion

$$\dot{M} = \lambda \dot{M}_{\text{bondi}} = 4\pi\lambda(GM_{\text{bh}})^2 \rho (v_{\text{bh}}^2 + c_s^2)^{-3/2}$$

$$L = \eta \dot{M}, \eta = 0.1 \dot{M} / \dot{M}_{\text{crit}} \text{ for } \dot{M} < \dot{M}_{\text{crit}}; \dot{M}_{\text{crit}} = 0.01 \dot{M}_{\text{edd}}$$

$$\rightarrow L \propto \dot{M}^2$$

We choose: $\lambda = 0.02 \rightarrow \dot{M} \sim \text{Sgr A}^*$

Primordial Black Holes in the Milky Way

Velocity Distribution

Gas model in the bulge:

Ferrière+2007, A&A, 467:611

Mass model in the bulge:

McMillan 2017, MNRAS, 465:76

Assume:

- Isotropic orbits
 - checked against Aquarius simulation
- $v(R) = v_{\text{circ}}(R)$
 - checked against phase-space calculation; valid for $v < 40 \text{ km/s}$

PBHs in the Milky Way: SKA predictions
