UHECRs, High-energy Nu, & Gamma Rays

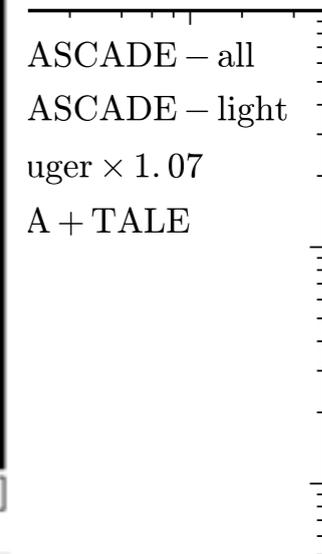

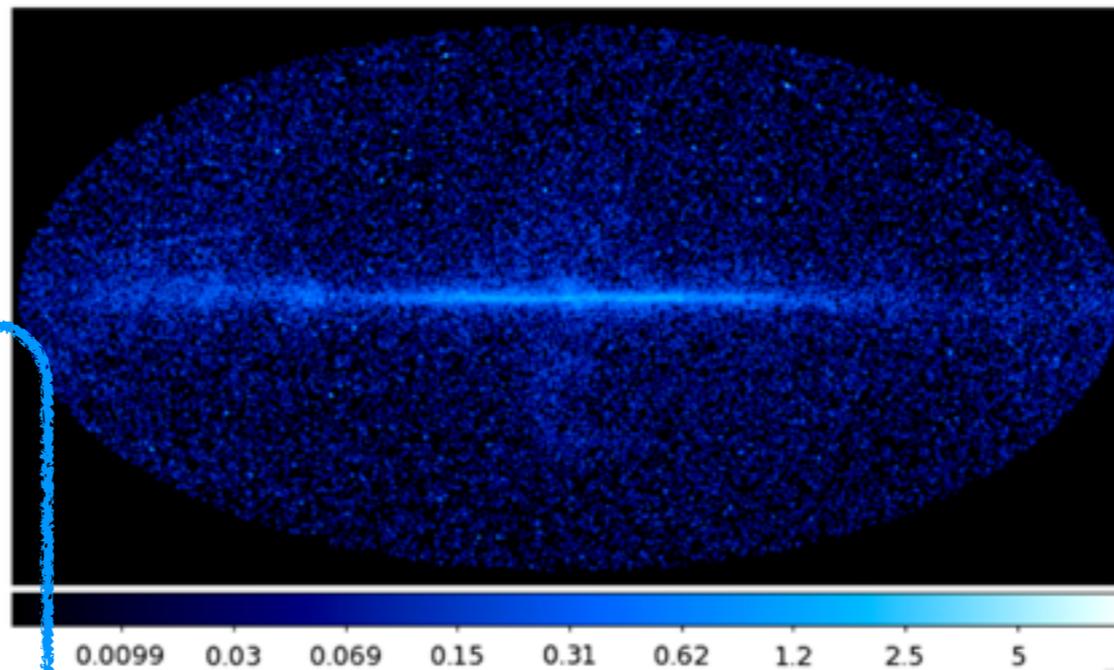

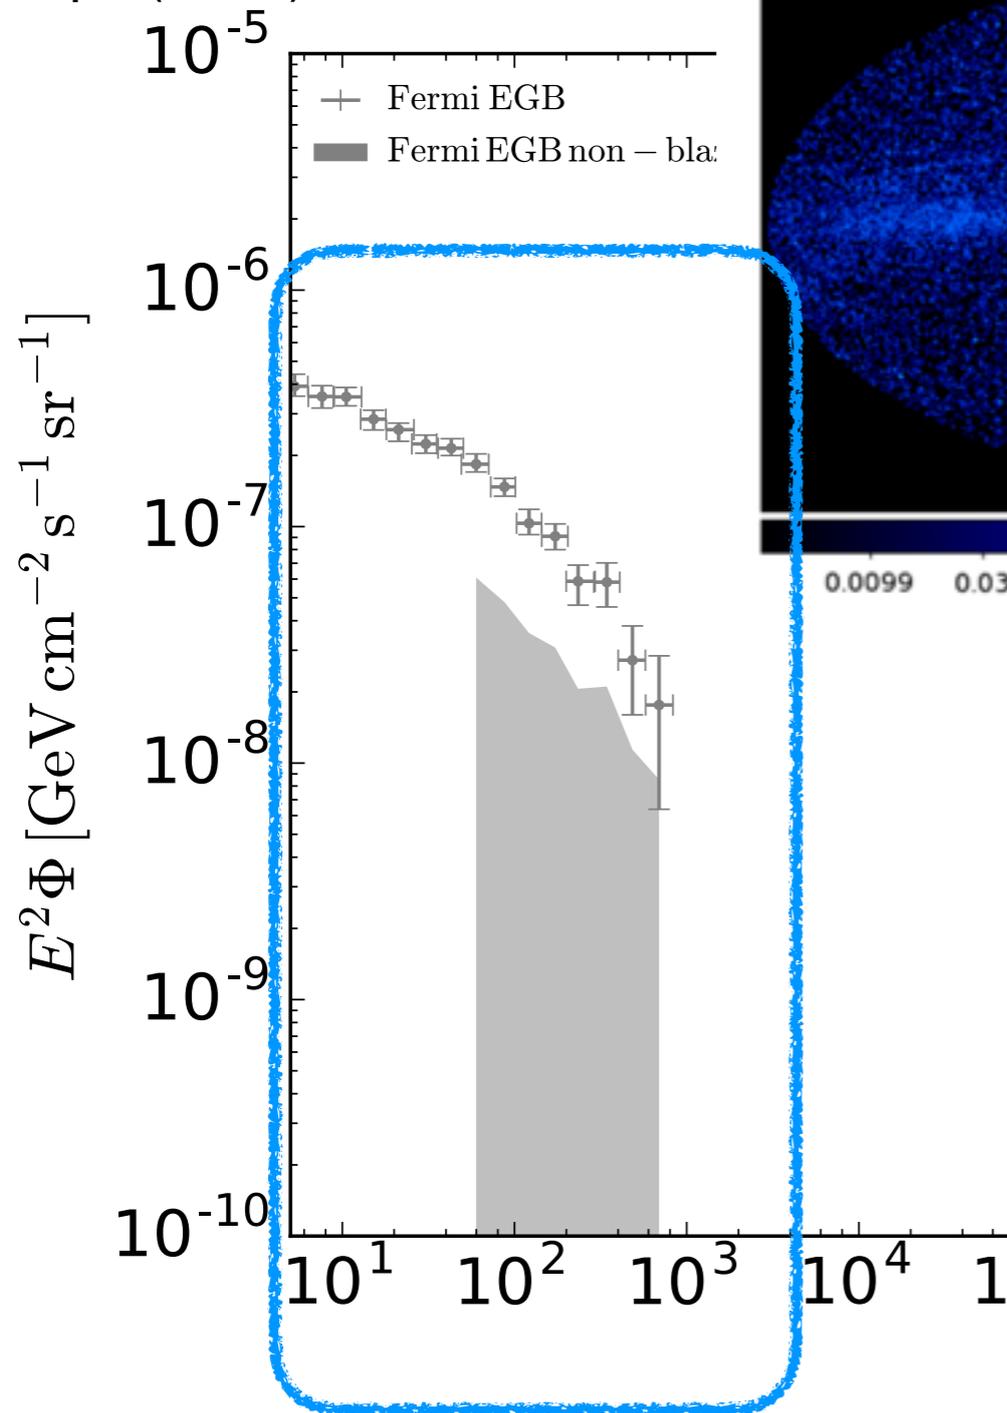

UHECRs, High-energy Nu, & Gamma Rays

UHECRs, High-energy Nu, & Gamma Rays

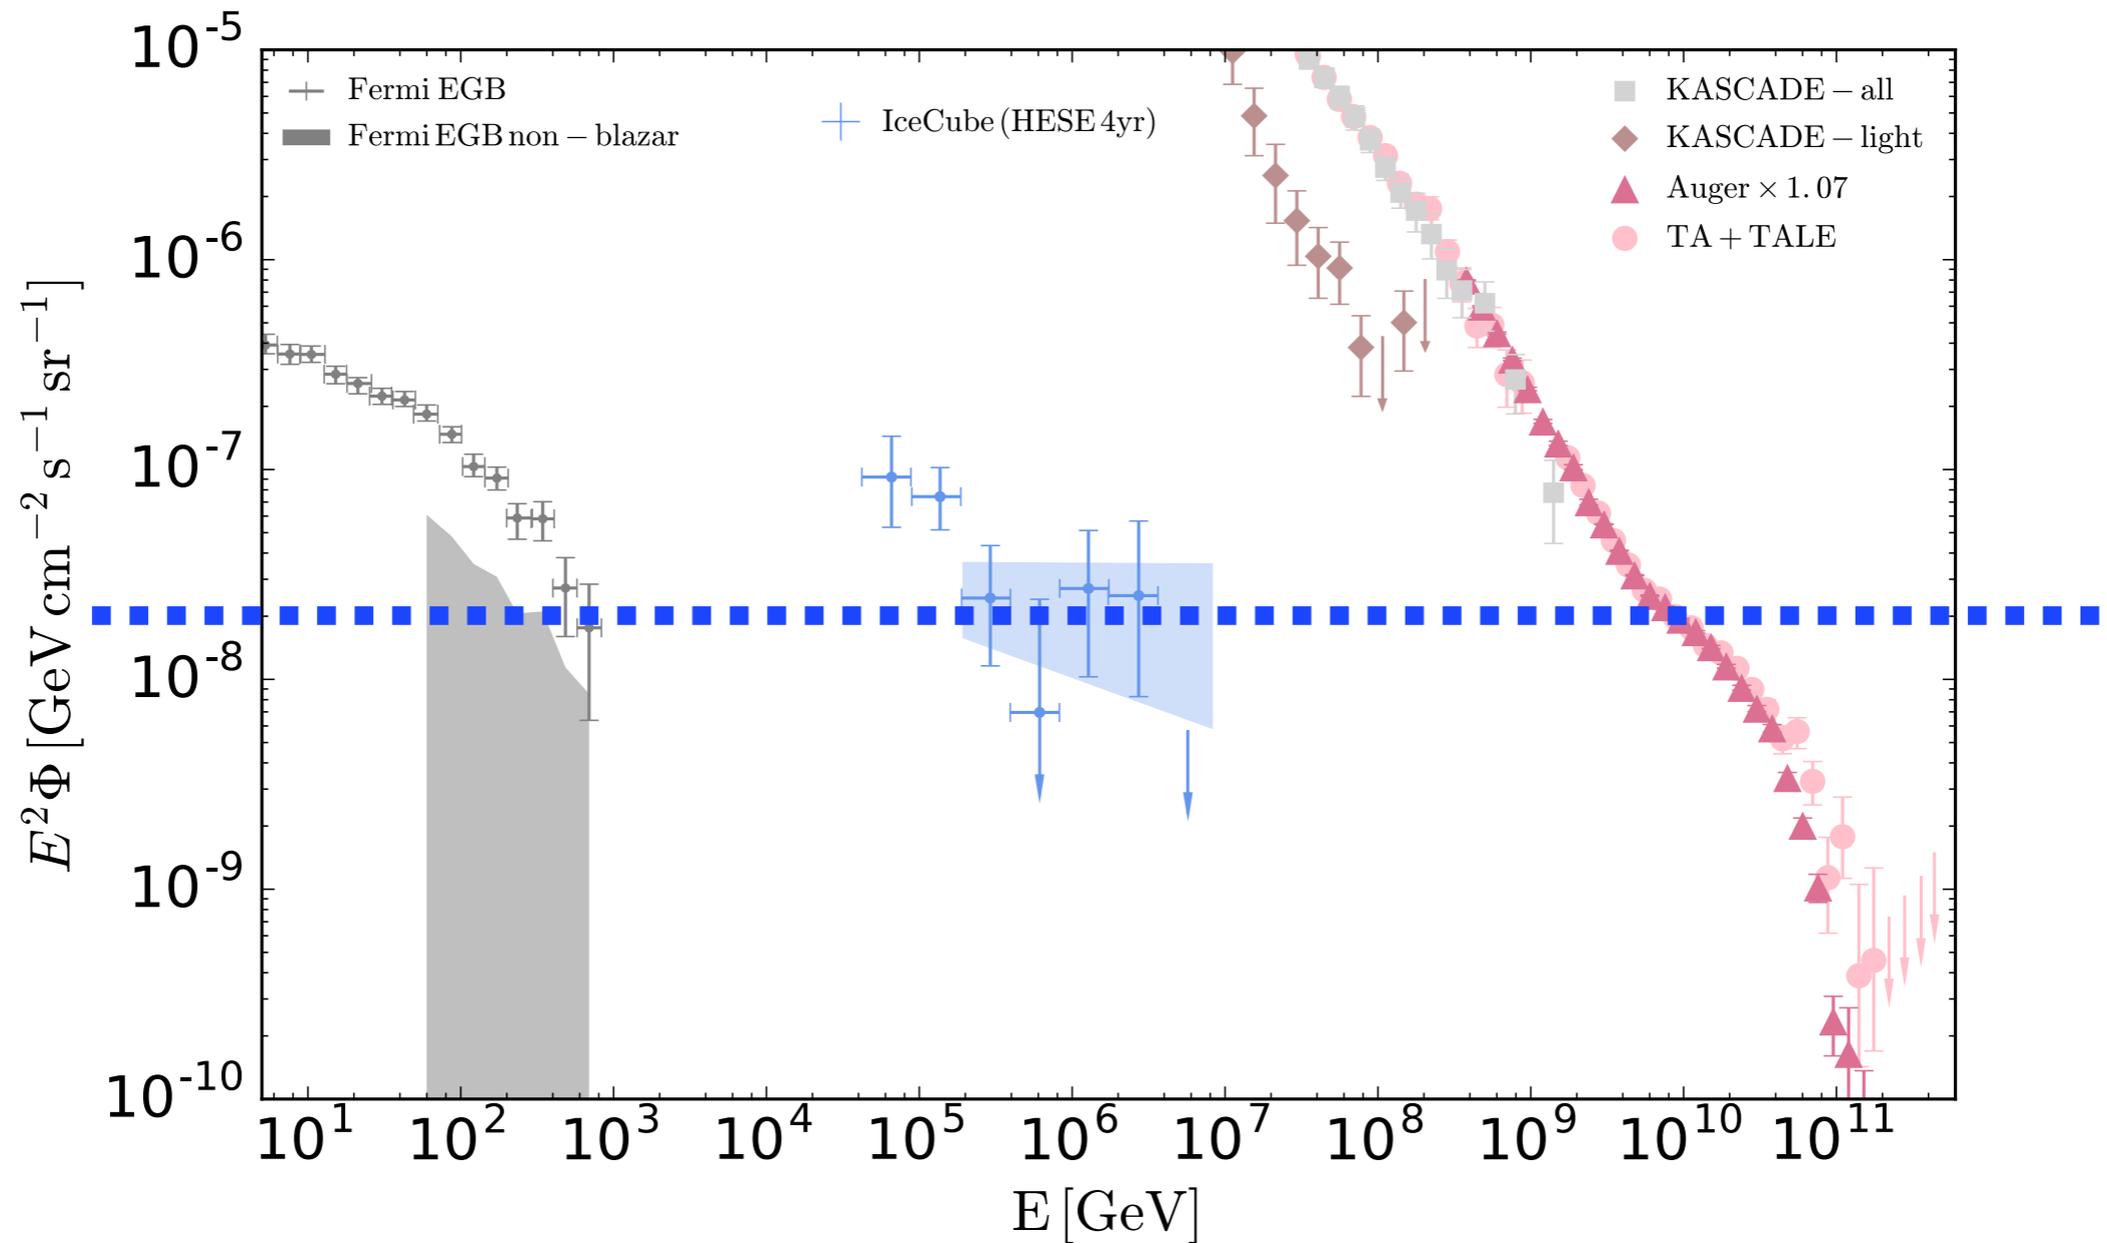

Fermi Collaboration, PRL (2016)

Lisanti + ApJ (2016)

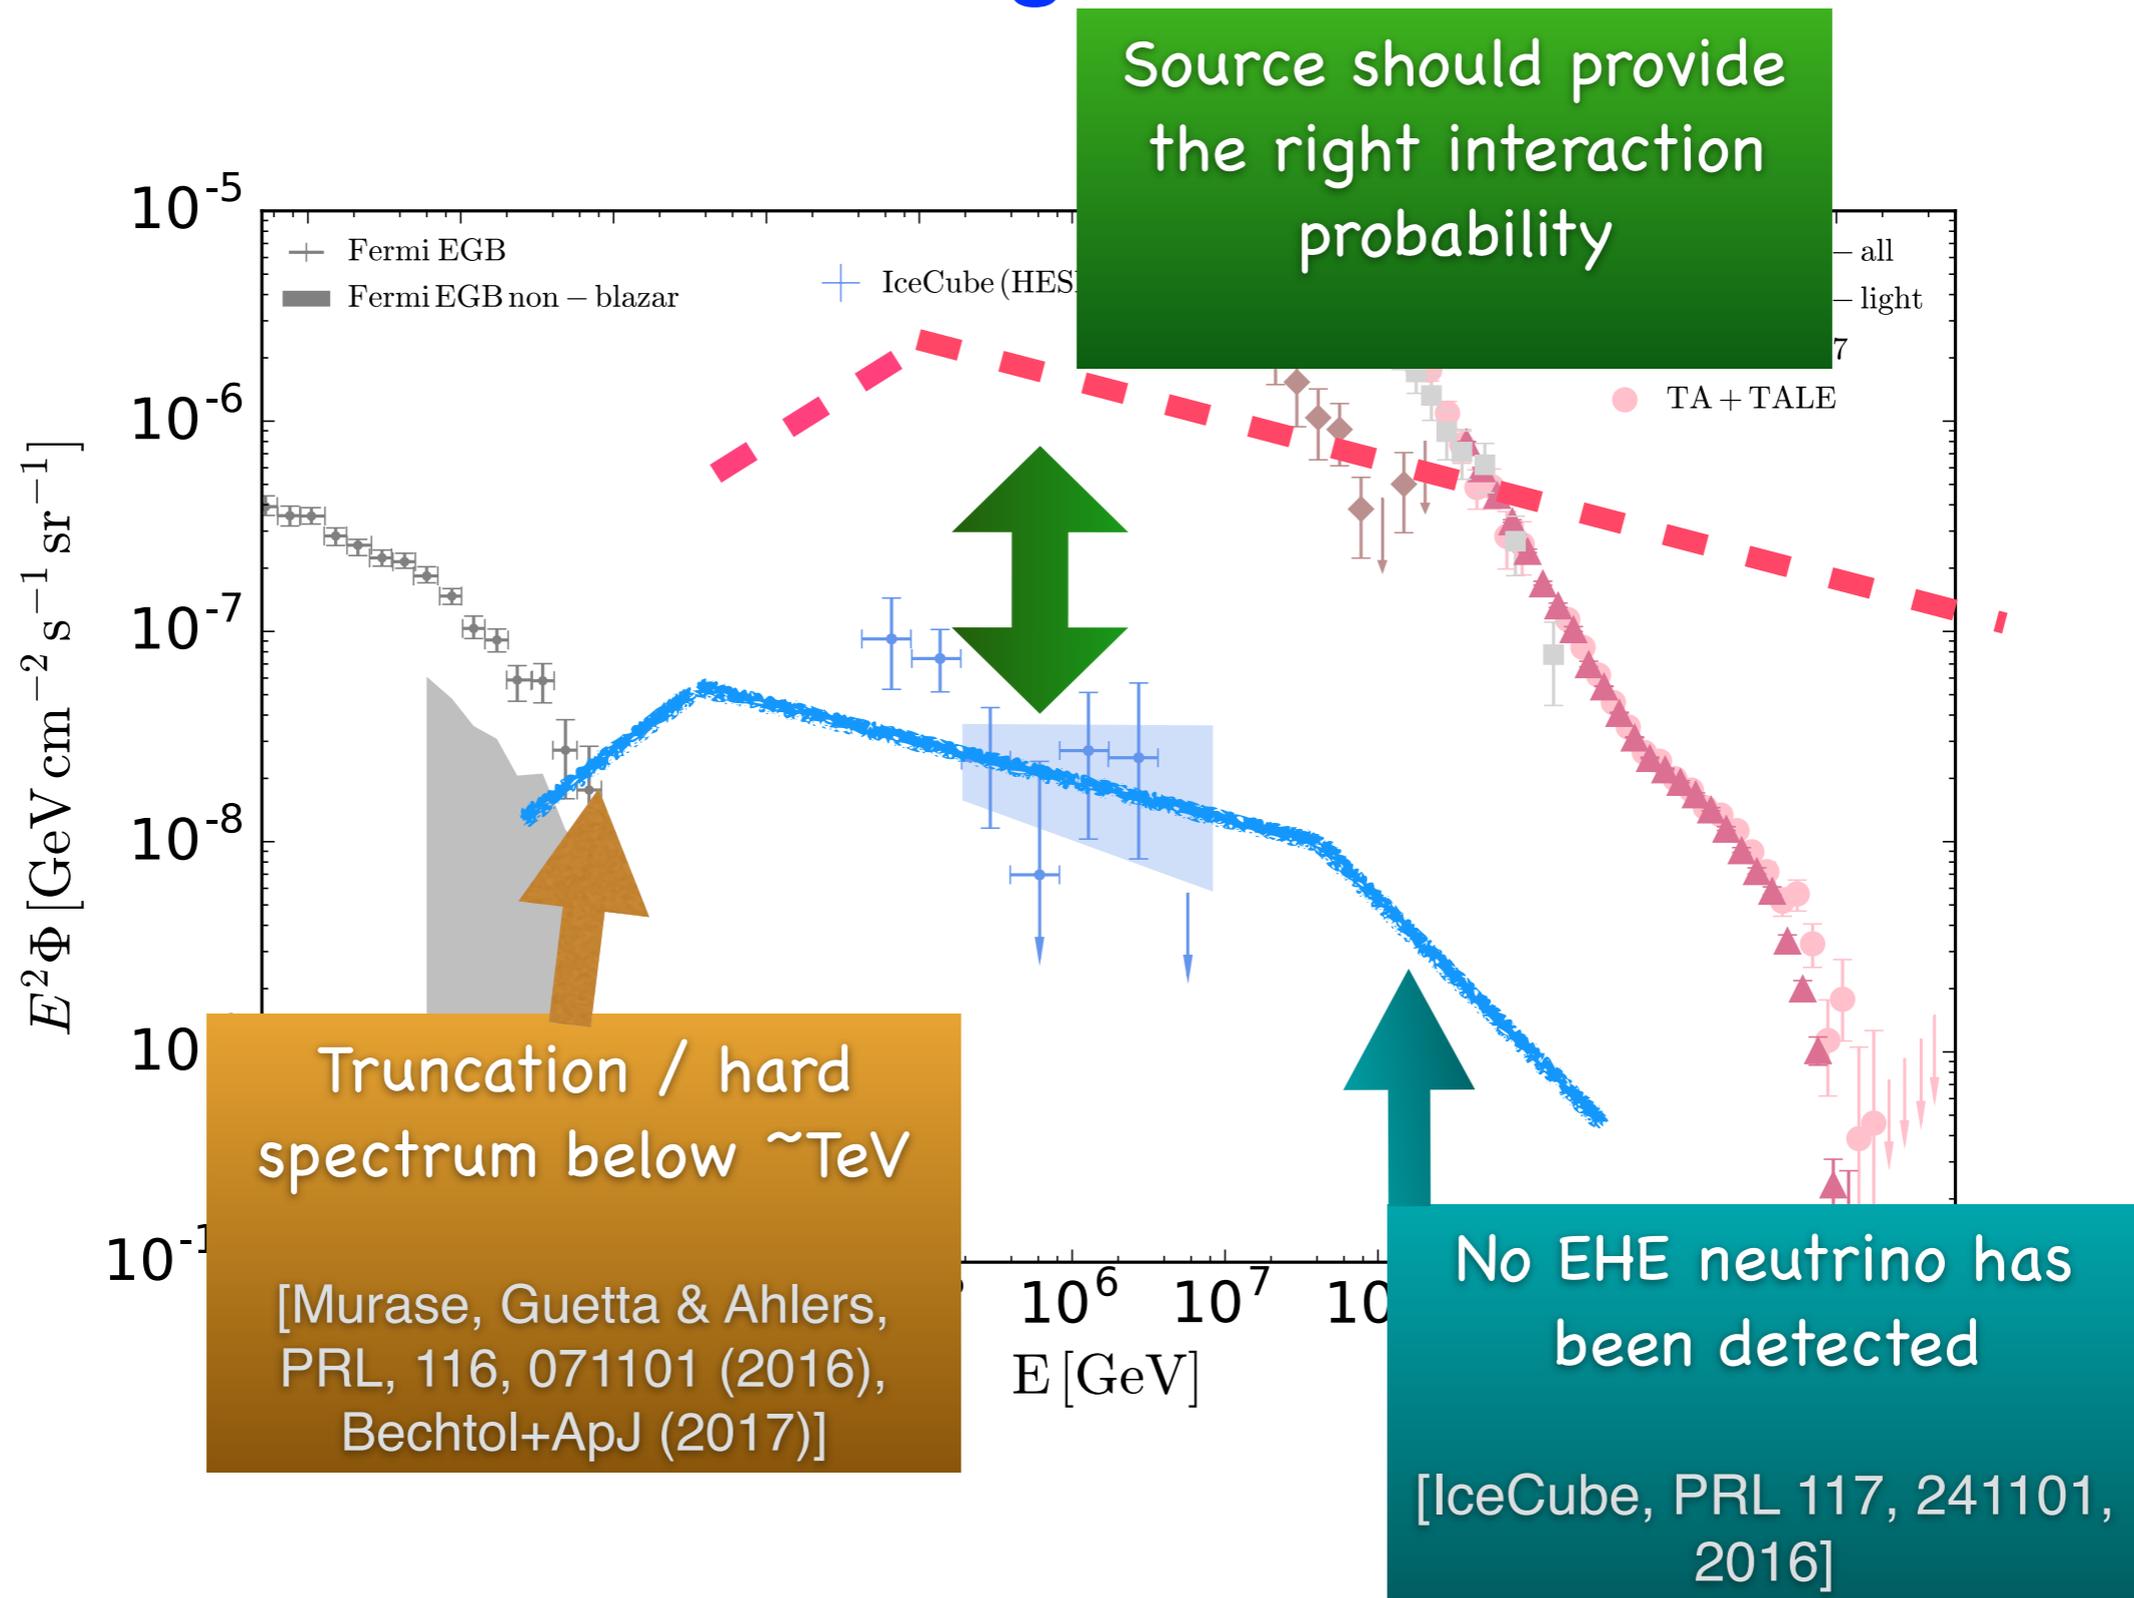

~14% of the Fermi extragalactic gamma-ray background is contributed by unknown sources.

When putting them together..

Despite ten orders of magnitudes difference in energy, UHECRs, IceCube neutrinos, Fermi non-blazar EGB share similar energy injection rate.

A common origin is not trivial

Cosmic Ray Production by the Jet

$$E \sim Z 10^{19} \left(\frac{B}{1 \mu\text{G}} \right) \left(\frac{R}{10 \text{ kpc}} \right) \text{ eV}$$

Cosmic rays that are confined by the radio lobes cool adiabatically

$$t_{\text{diff}}^{\text{lobe}} \sim 6.1 \left(\frac{E/Z}{1 \text{ PeV}} \right)^{-1/3} \text{ Myr}^*$$

$$t_{\text{cool}} \sim 5 \text{ Myr}$$

Only particles above $\sim \text{PeV}$ leave the source

*taking a typical lobe size 10 kpc, coherence length 0.3 kpc, magnetic field strength 5 μG , and expansion velocity 2000 km/s.

Cluster Environment

ICM gas

$$n_{\text{ICM}}(r) = n_{\text{ICM},0} \left[1 + \left(\frac{r}{r_c} \right)^2 \right]^{-3\beta/2}$$

$$B(M, r) \propto n(M, r)^\eta$$

Infrared background from galaxies

[Takami & Murase ApJ 2012]

CMB, EBL

CRPropa3 + SOPHIA for turbulent field & N_γ

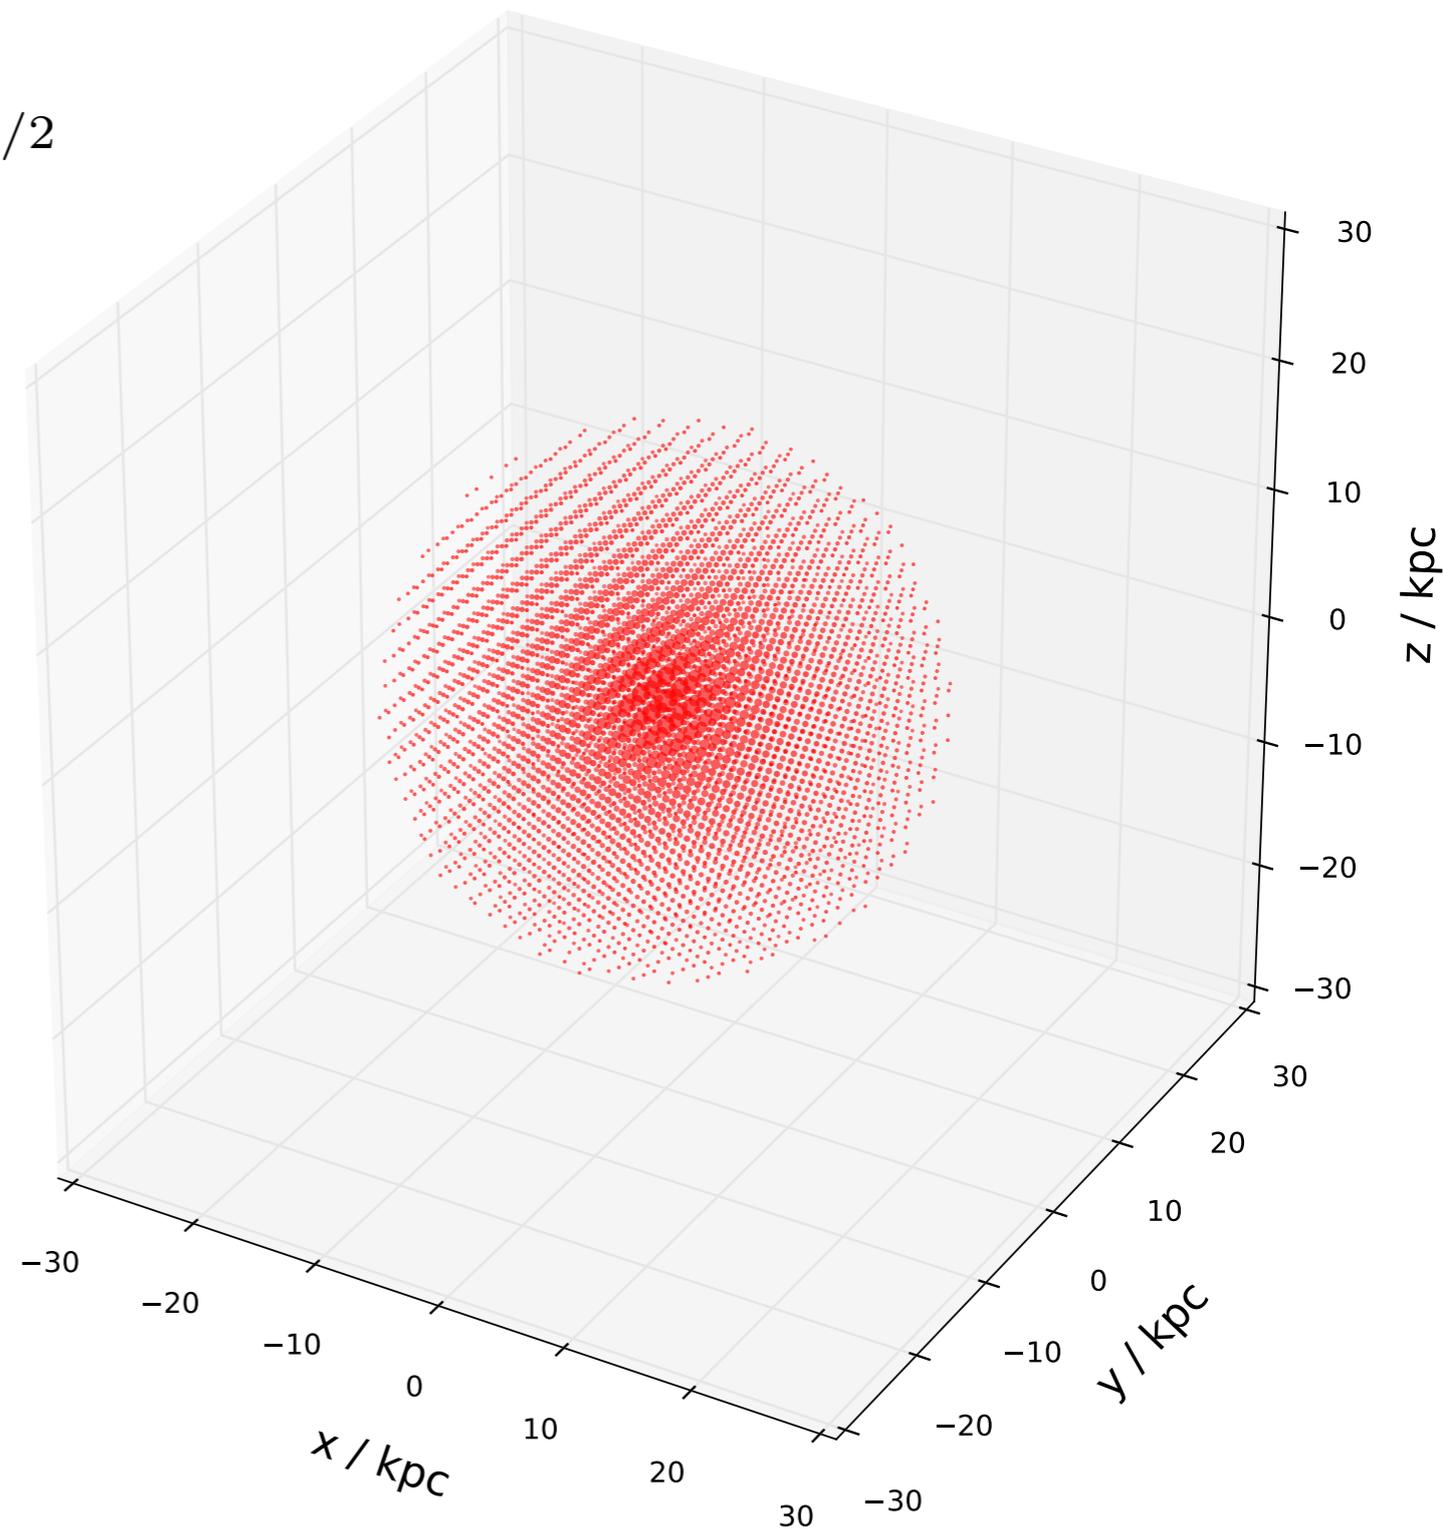

[Batista+ JCAP (2016)]

EPOS for N_p

[KF, Kotera & Olinto ApJ (2012)]

Diffuse propagation

[Kotera & Lemoine PRD (2007), KF & Olinto ApJ (2016)]

Particle Trajectory - 10 EeV

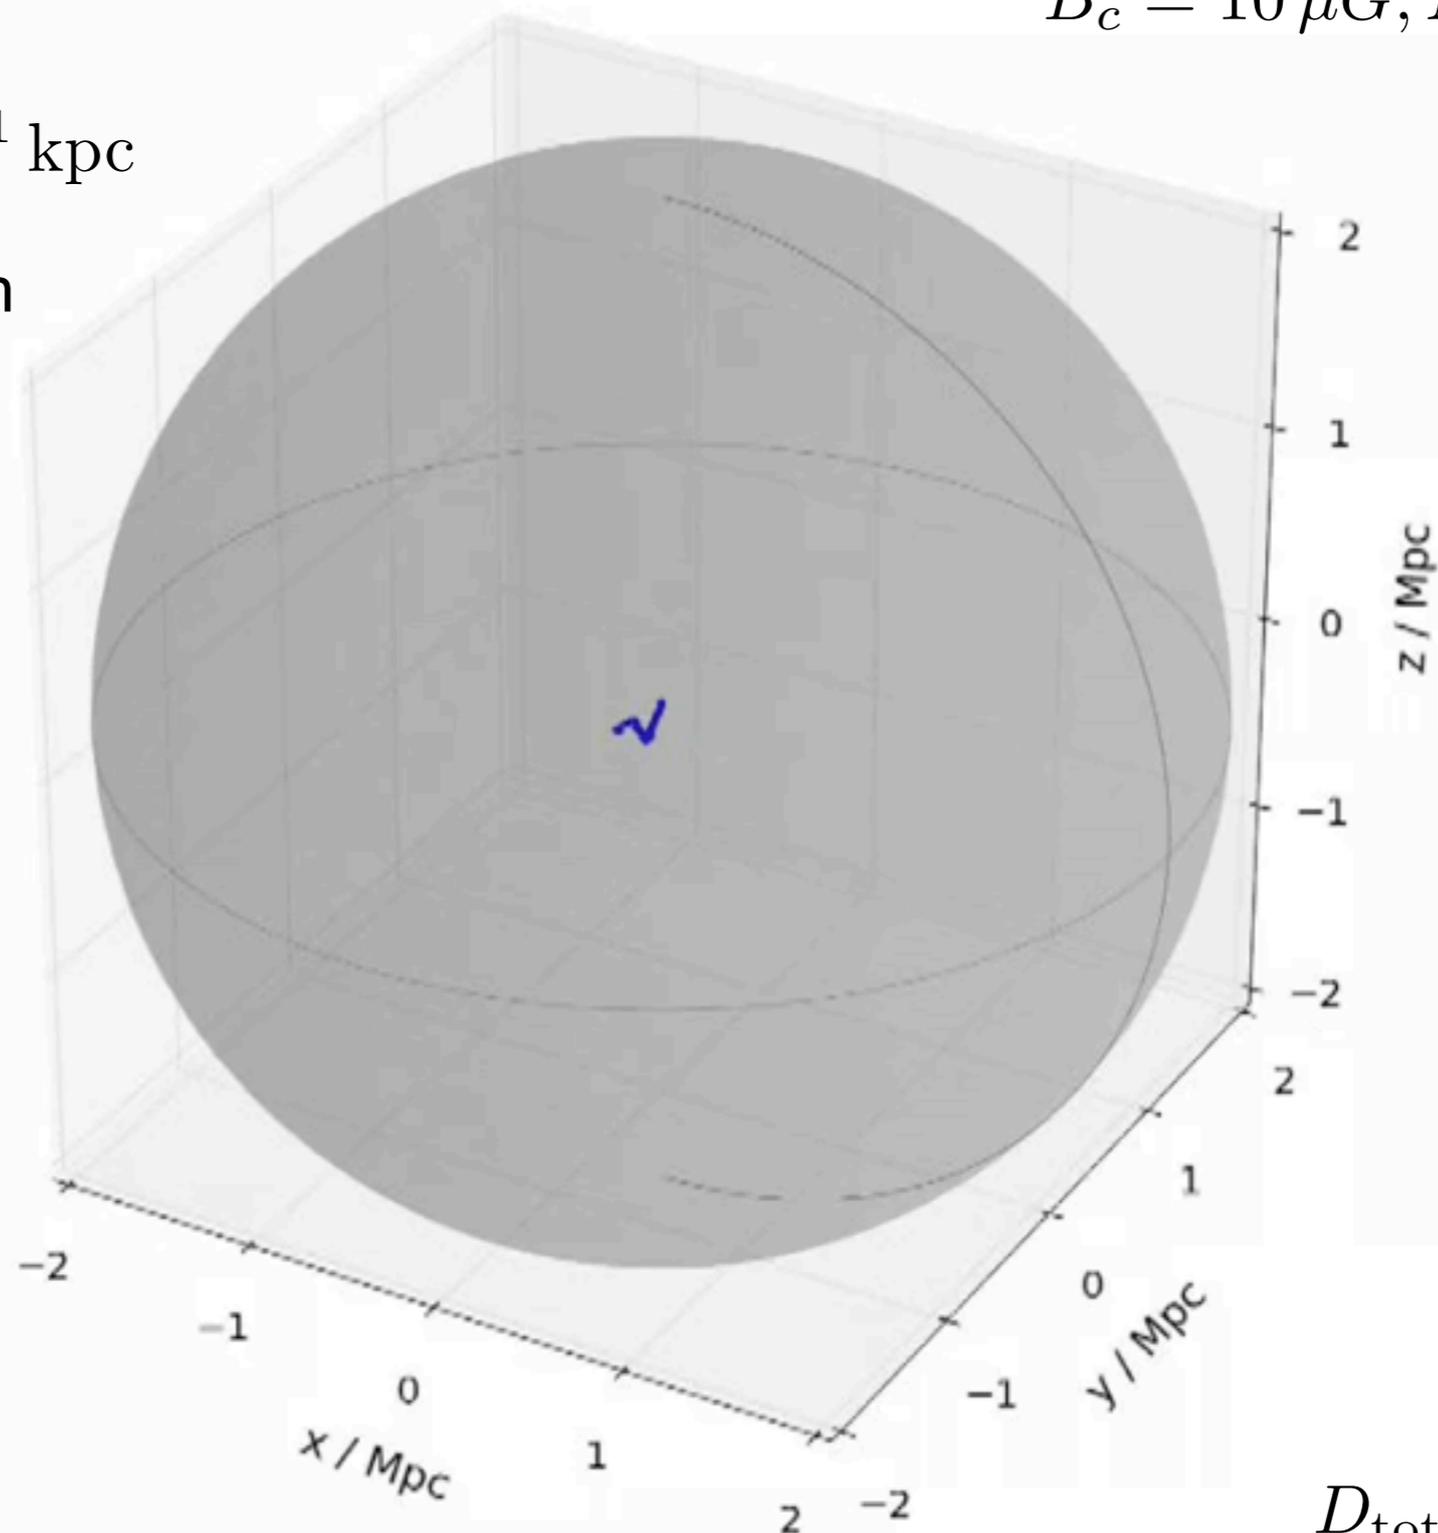

$$B_c = 10 \mu\text{G}, M = 10^{15} M_\odot$$

Particle Larmor Radius

$$r_L = 10 E_{19} B_{-6}^{-1} Z^{-1} \text{ kpc}$$

Field Coherence Length

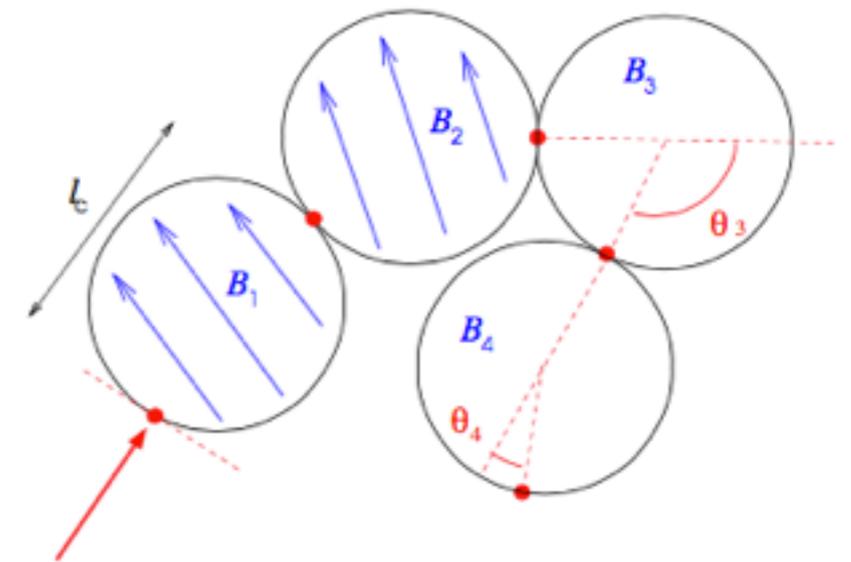

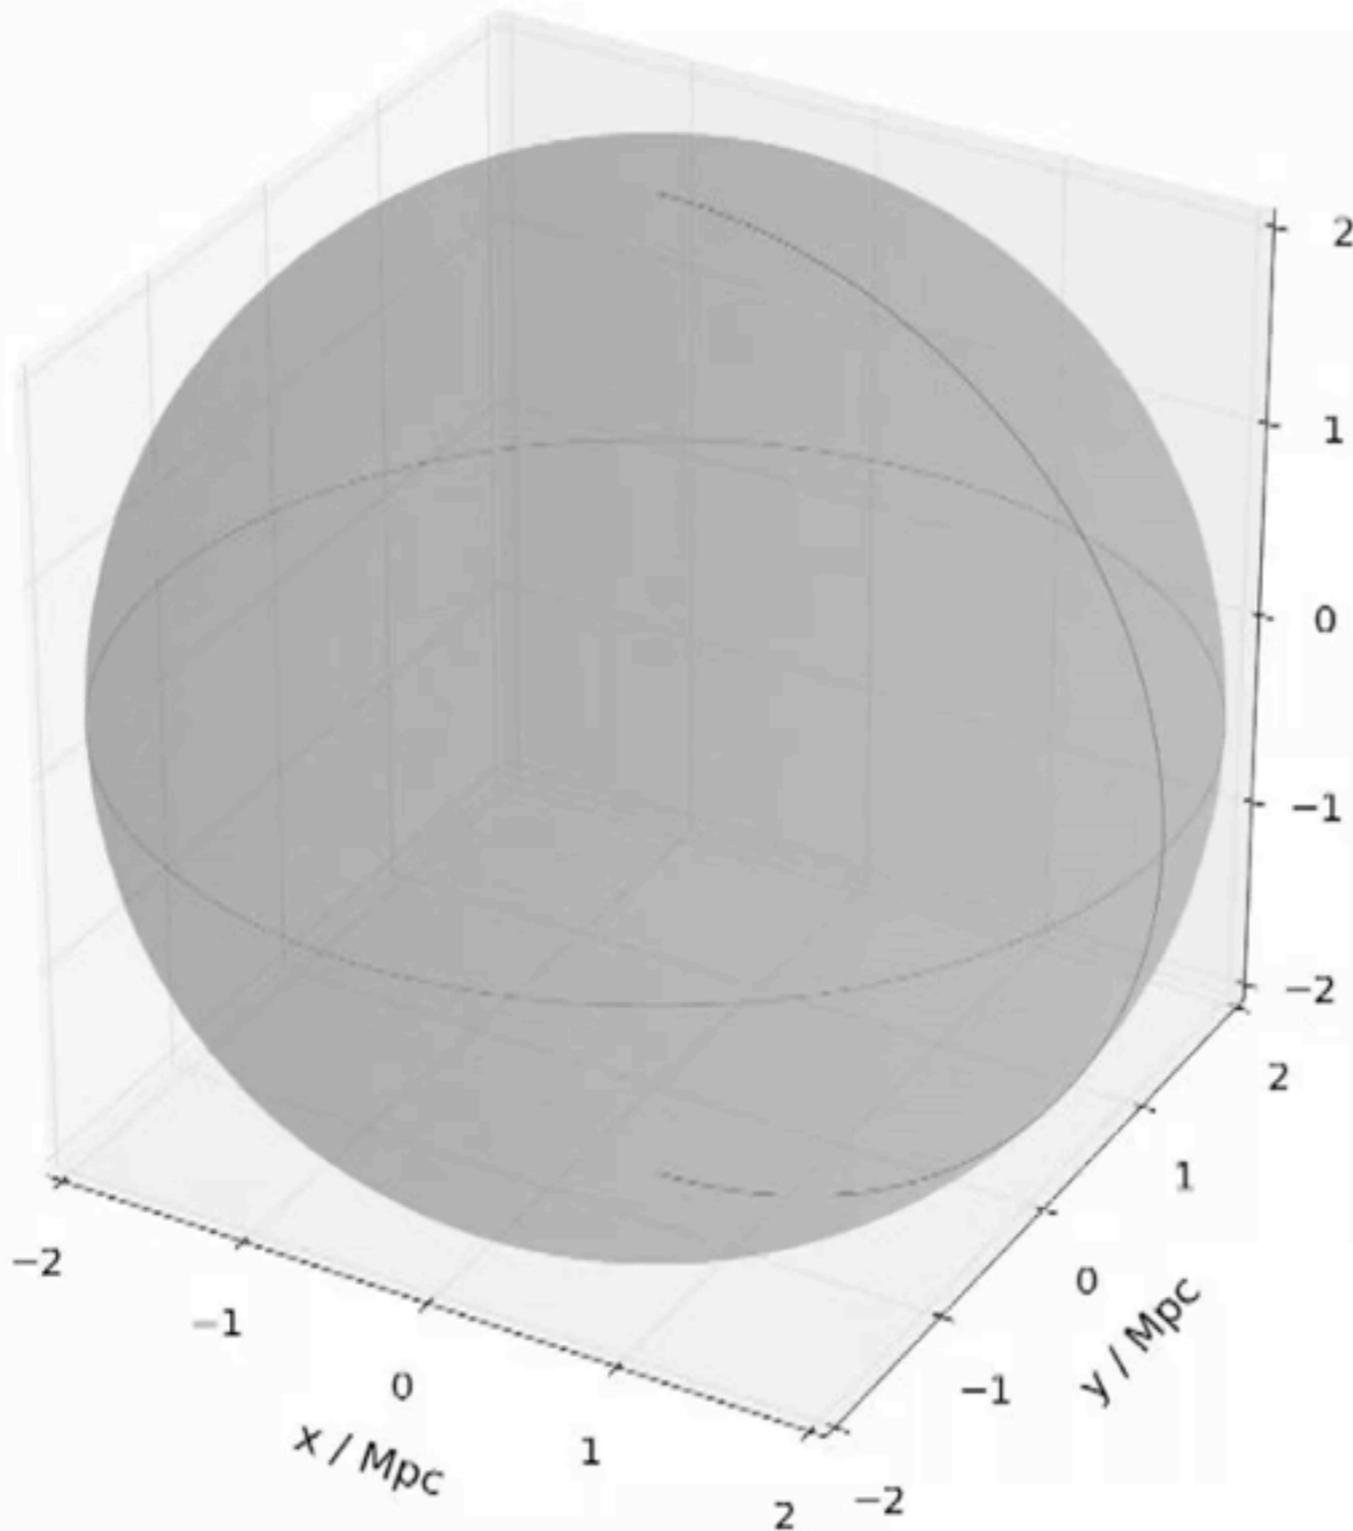

$$l_0 \sim 20 \text{ kpc}$$

$$D_{\text{total}} = 46 \text{ Mpc}$$

Particle Trajectory - 0.1 EeV

$$B_c = 10 \mu G, M = 10^{15} M_\odot$$

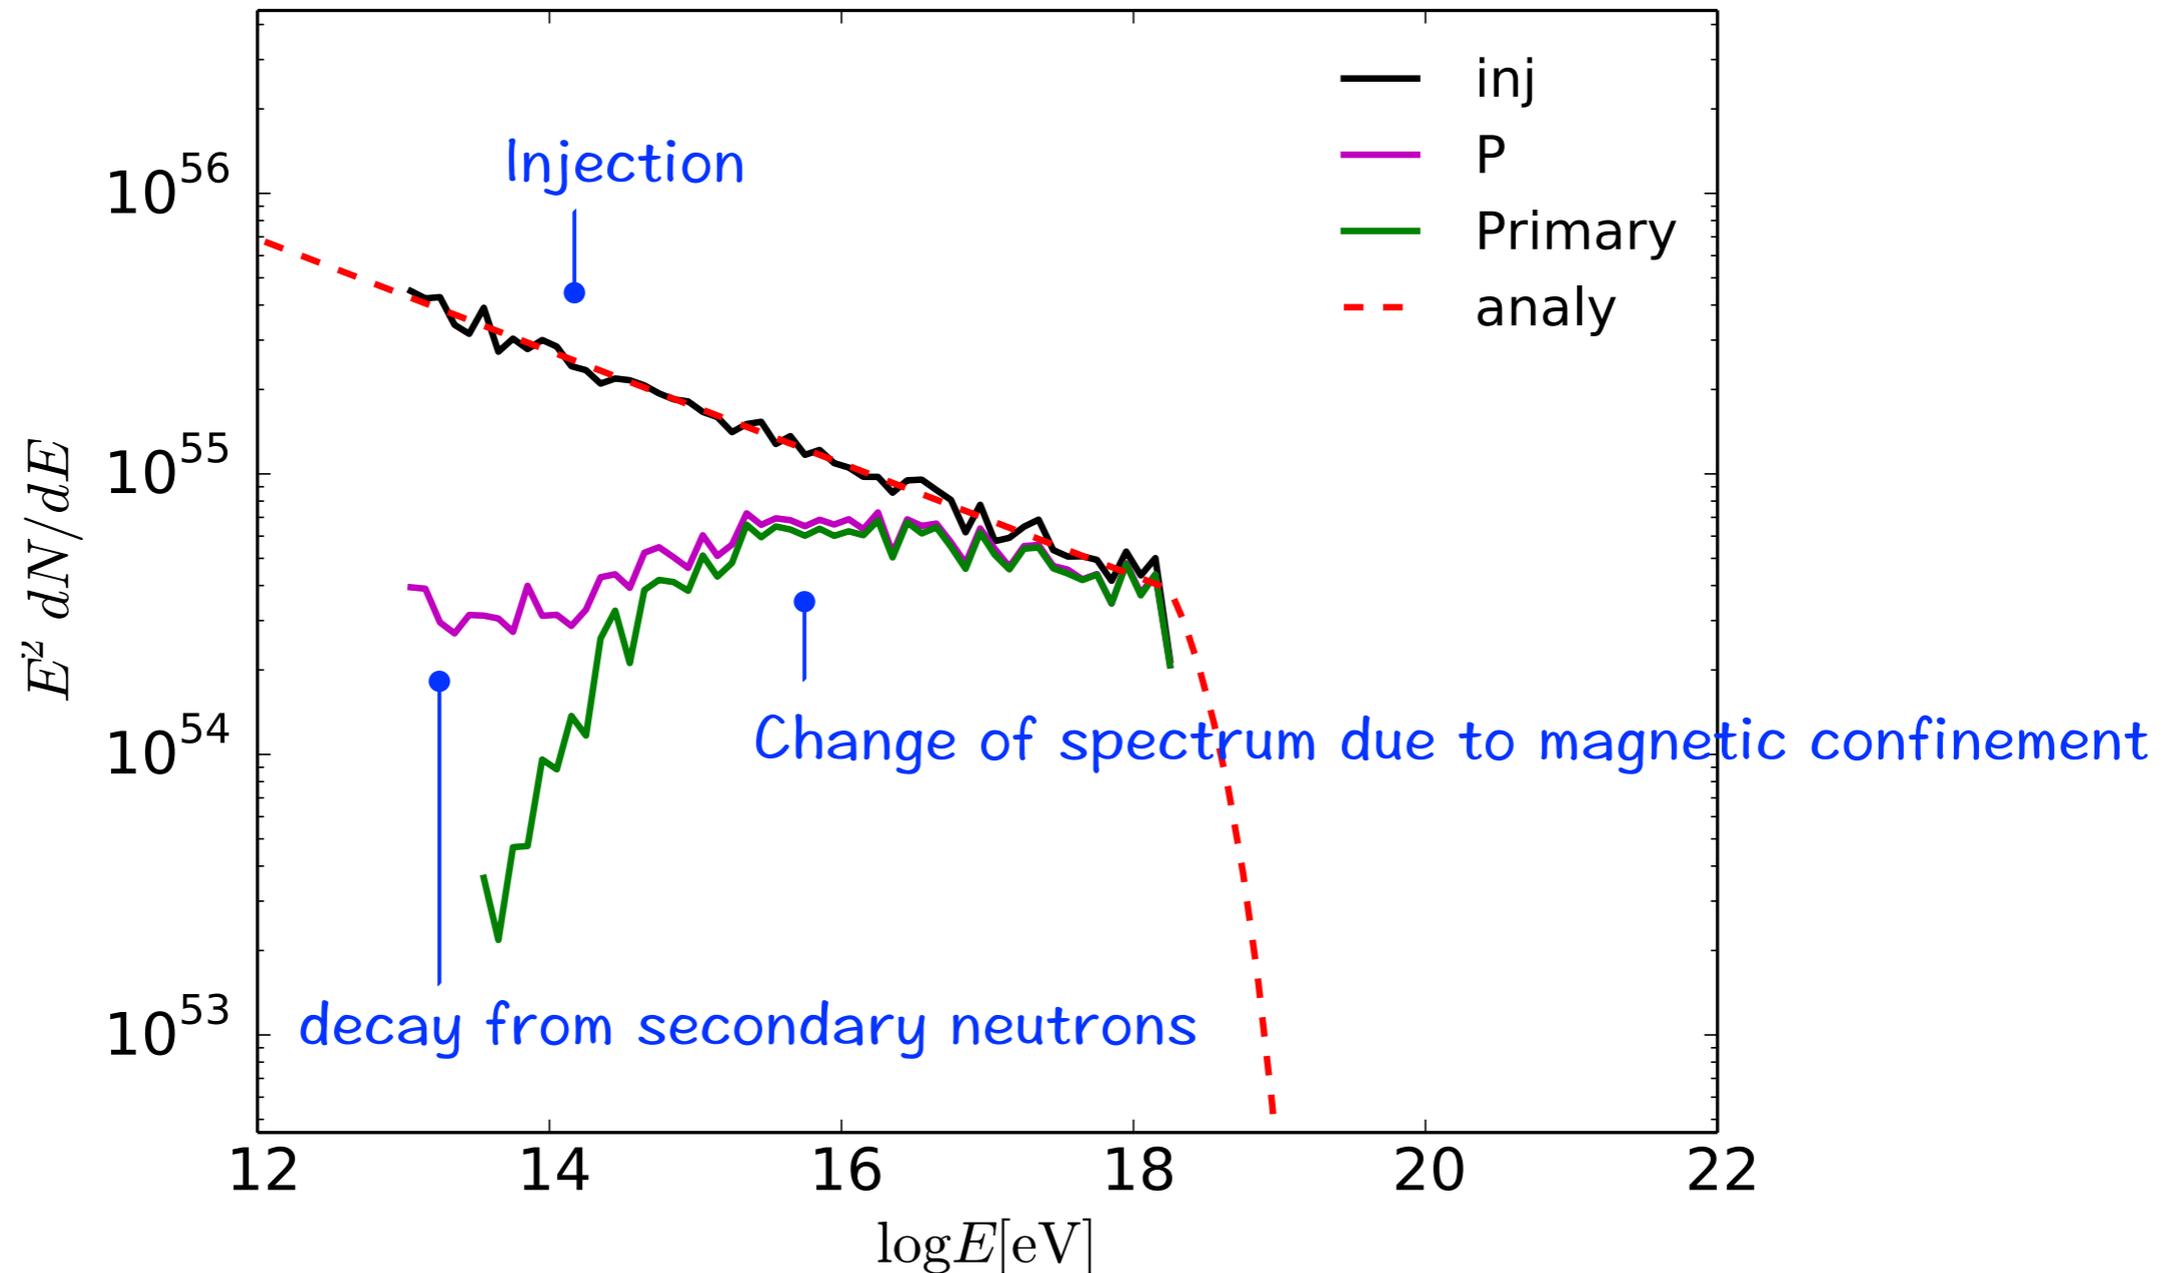

Approximation for diffusion computation

$$D_{\text{total}} \sim t_{\text{Hubble}}$$

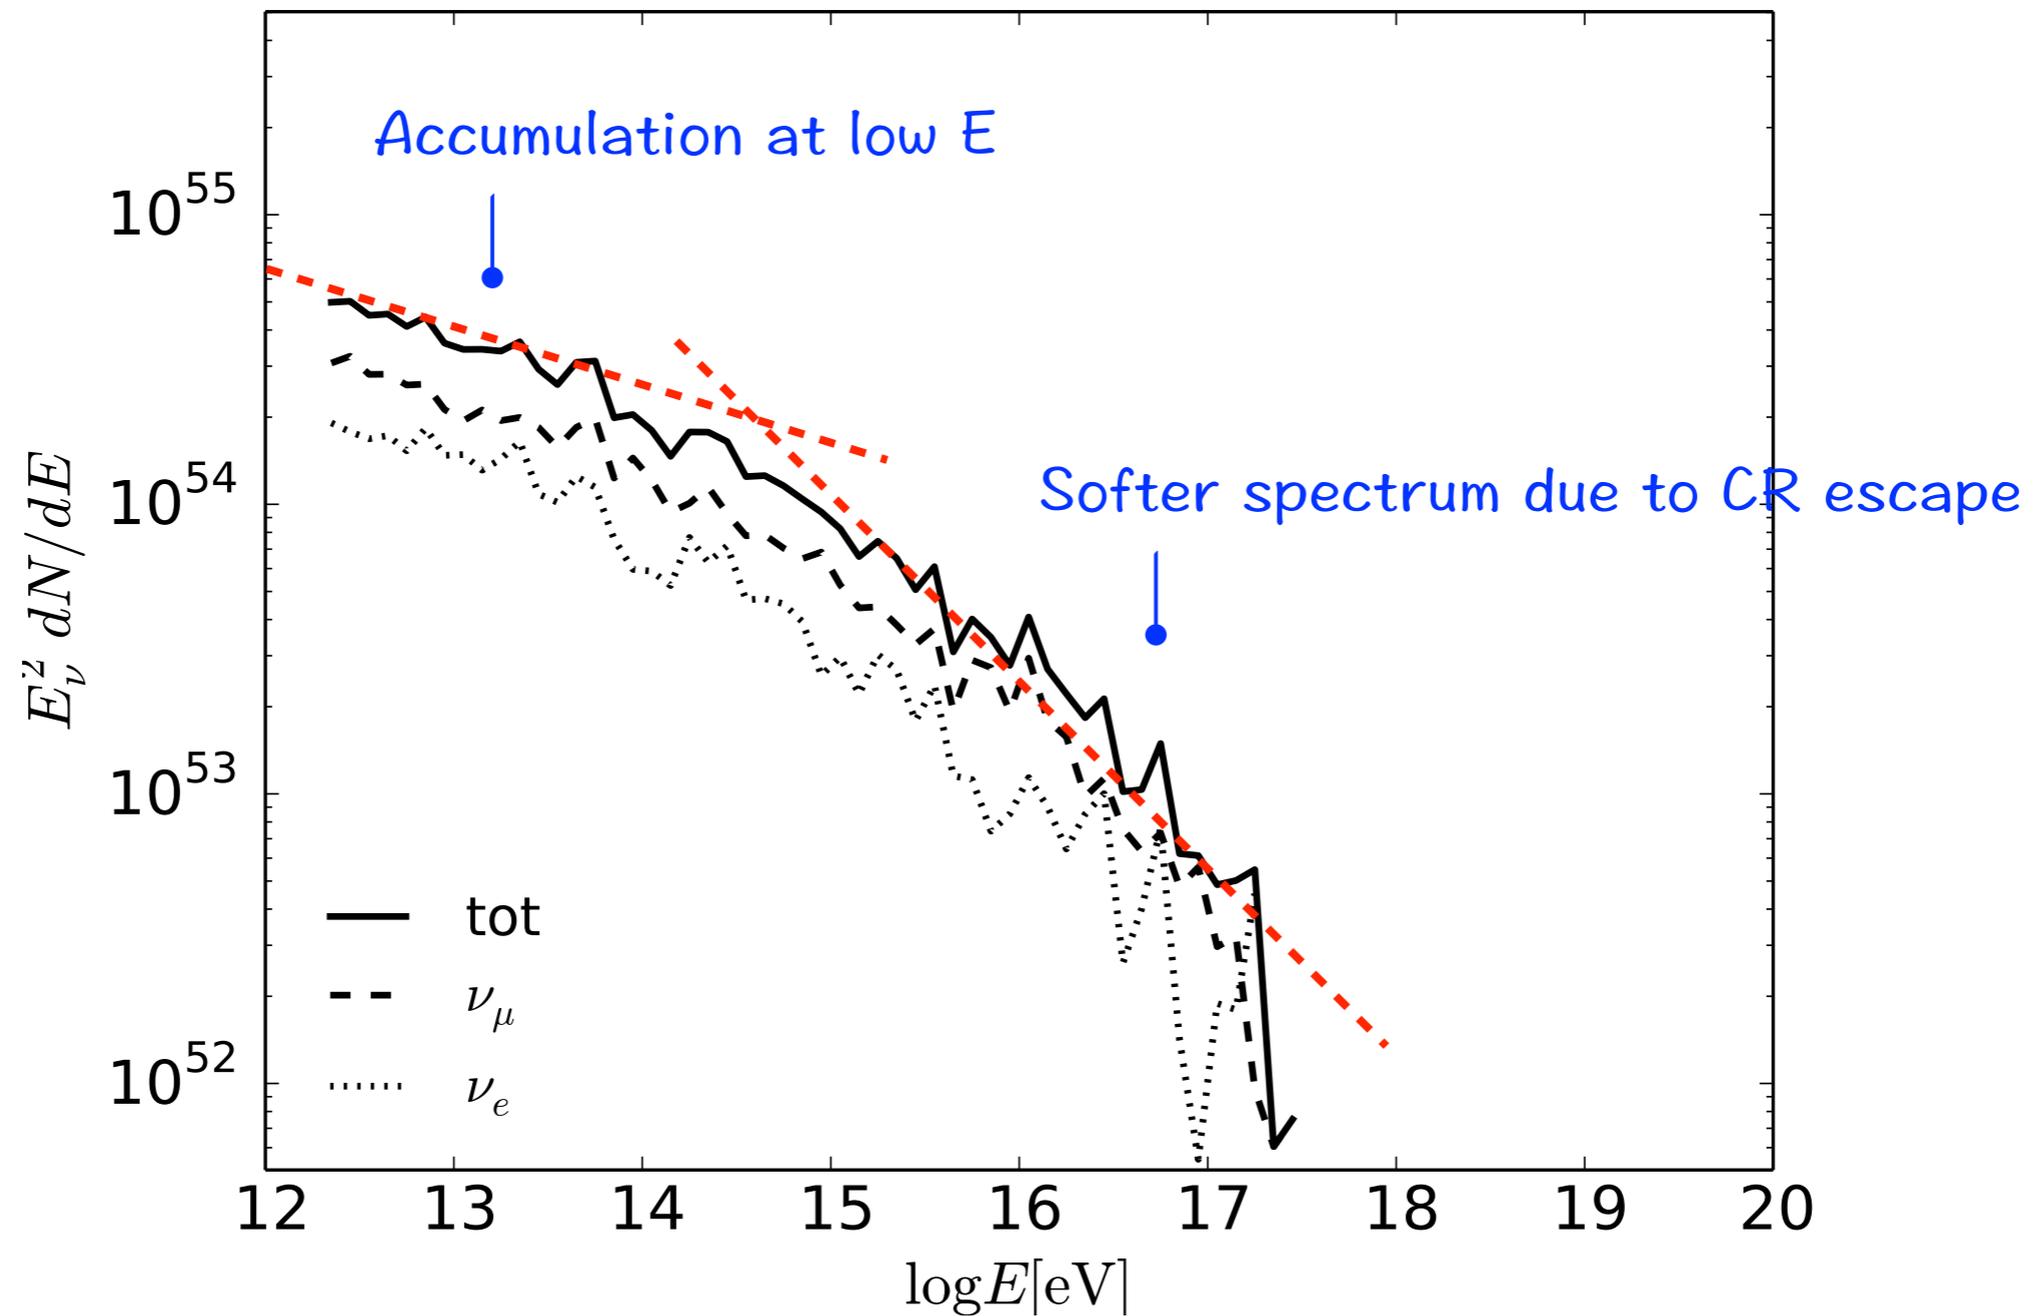

Cosmic Ray Flux from One Single Cluster

$$B_c = 10 \mu G, M = 10^{15} M_\odot$$

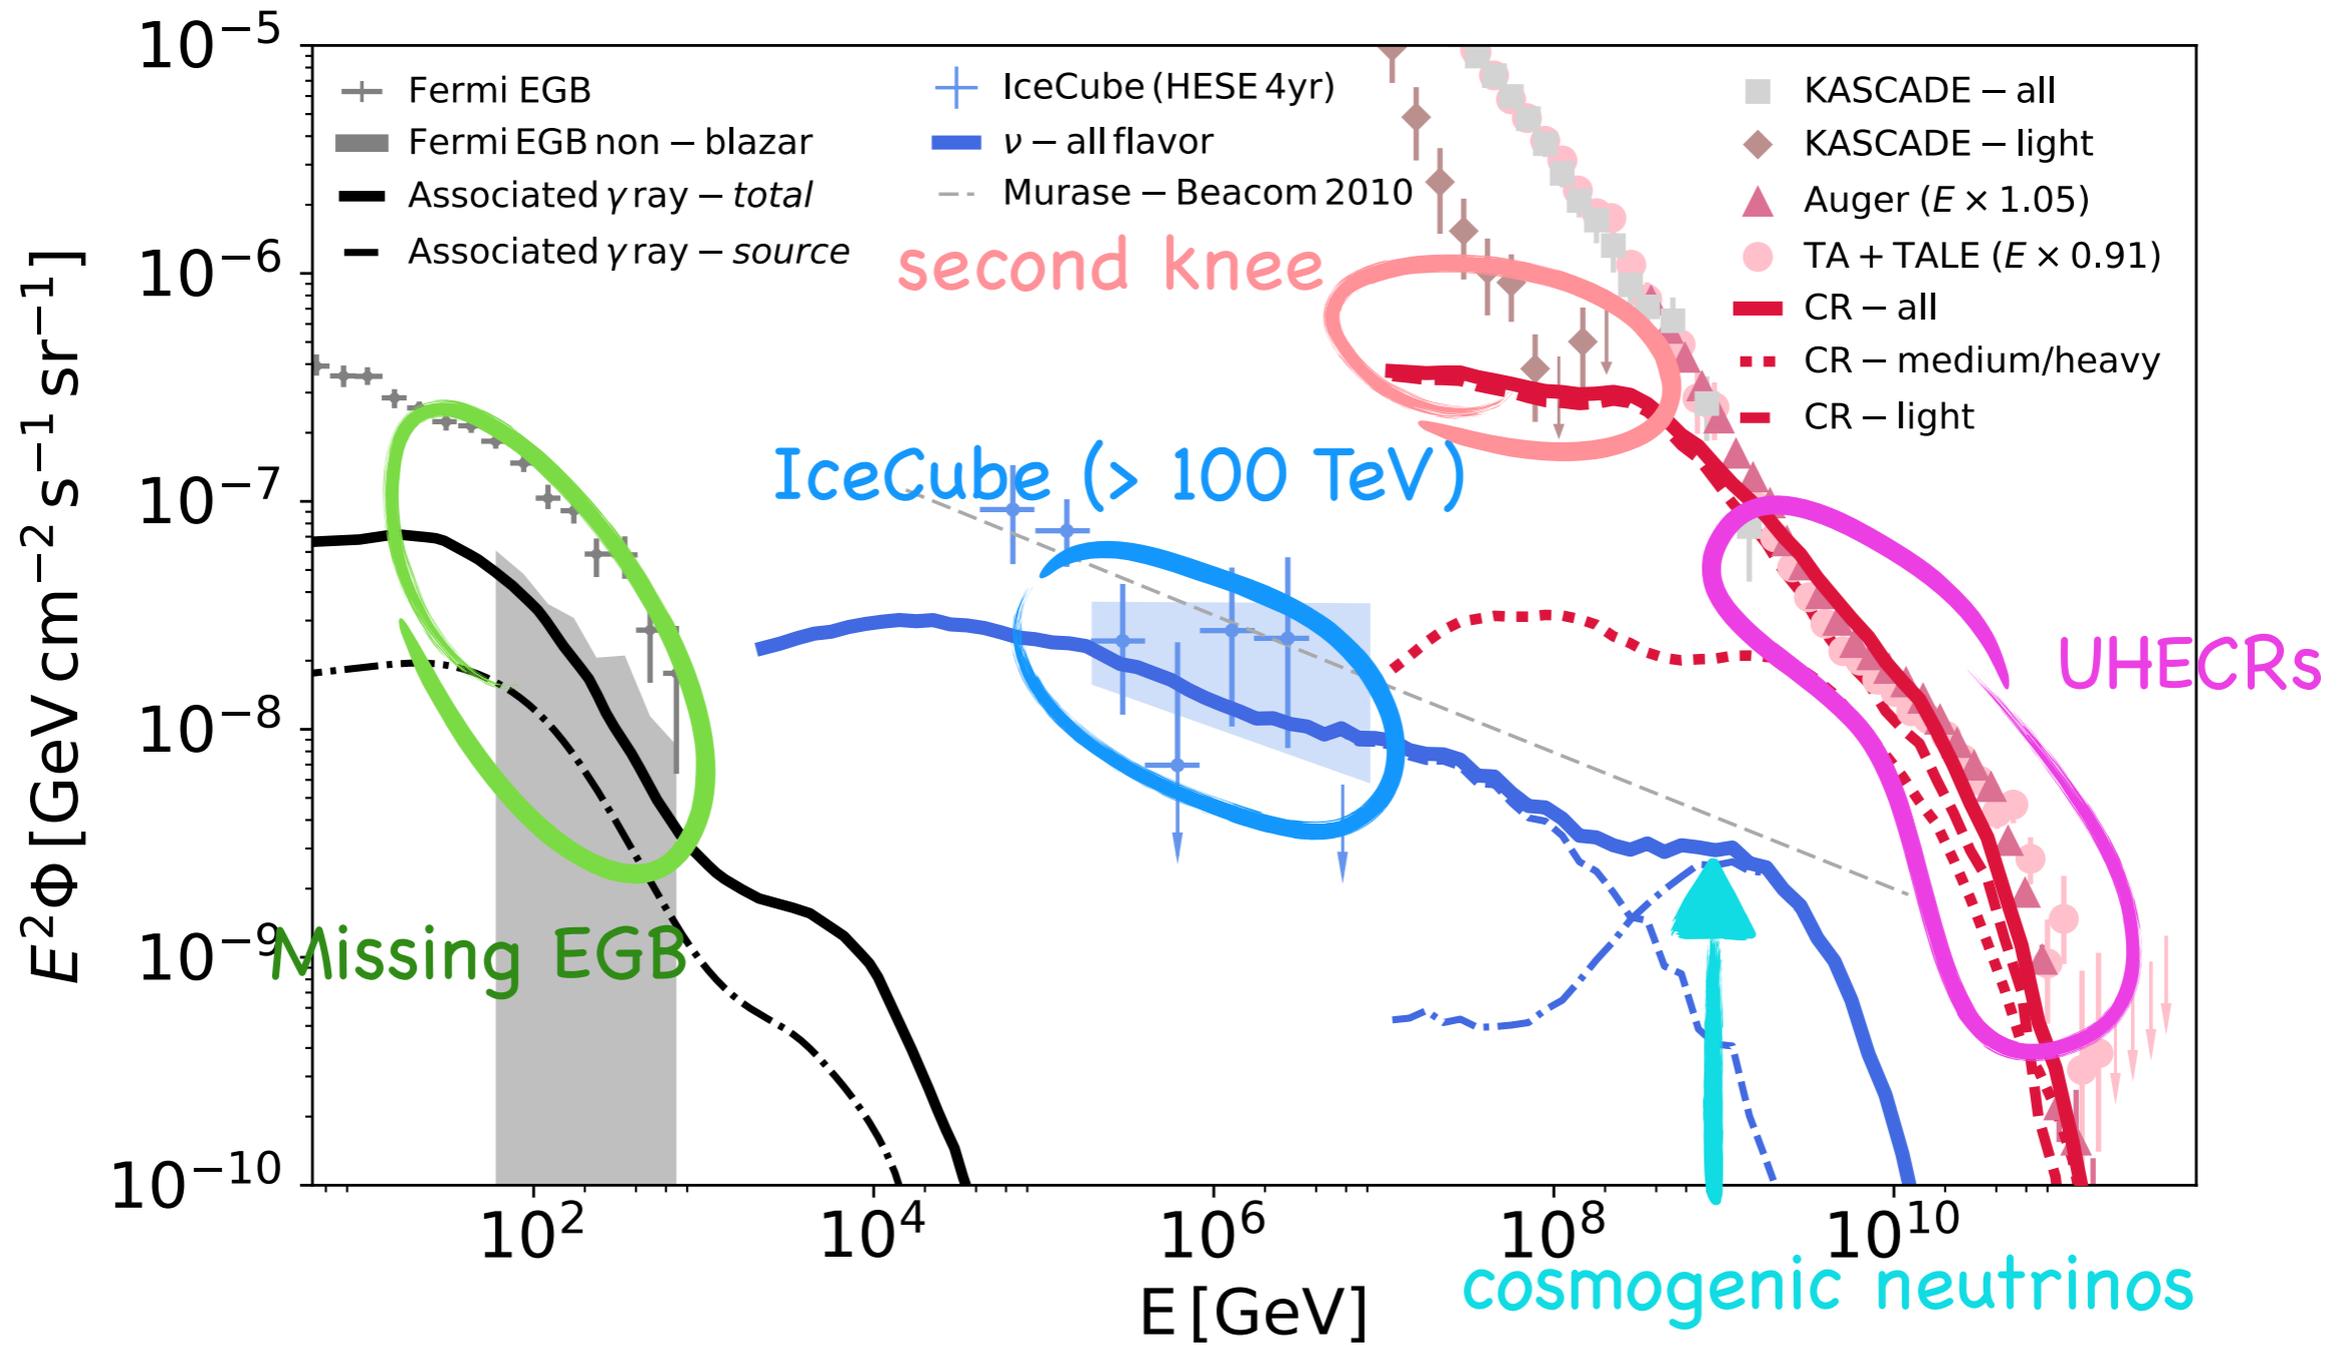

Neutrino Flux from One Single Cluster

$$B_c = 10 \mu G, M = 10^{15} M_\odot$$

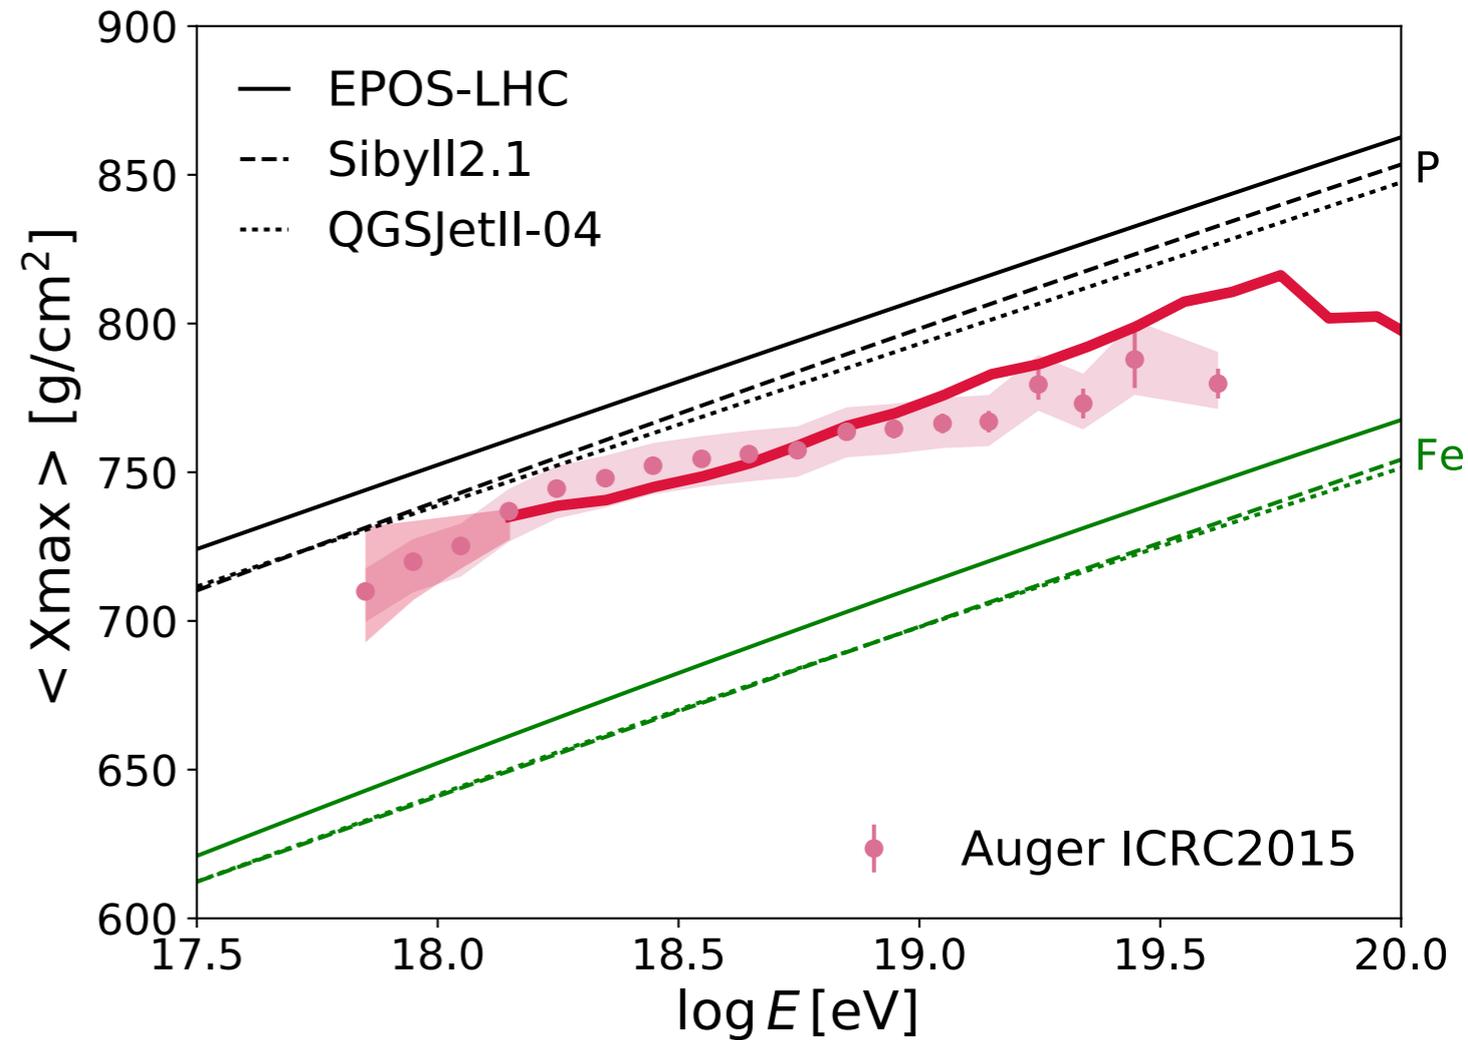

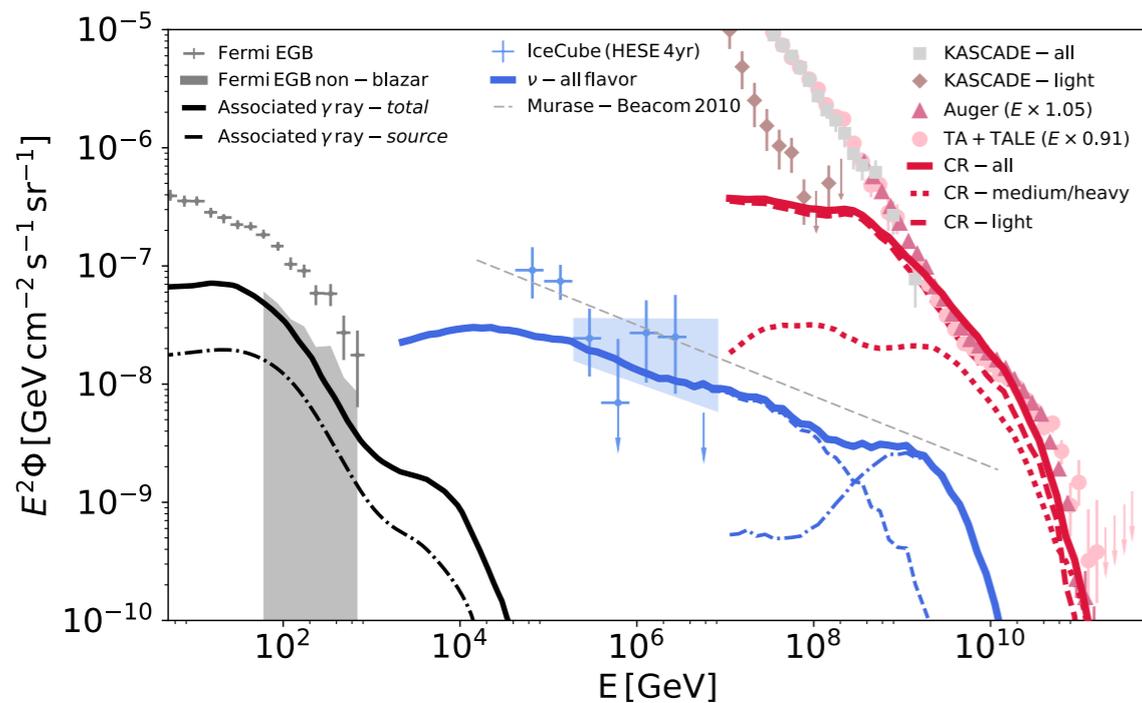

Cosmic Particles from Black Hole Jets in Clusters

Injection Composition = Galactic CR abundance

A Unification Picture of Multi-messengers

Black hole jets embedded in massive clusters can simultaneously explain UHECRs, high-energy neutrinos, and the non-blazar component of isotropic gamma-ray background.
