

OBSERVING THE  
POLARIZATION OF  
THE CMB WITH  
**SPIDER**

Aug 7, 2017

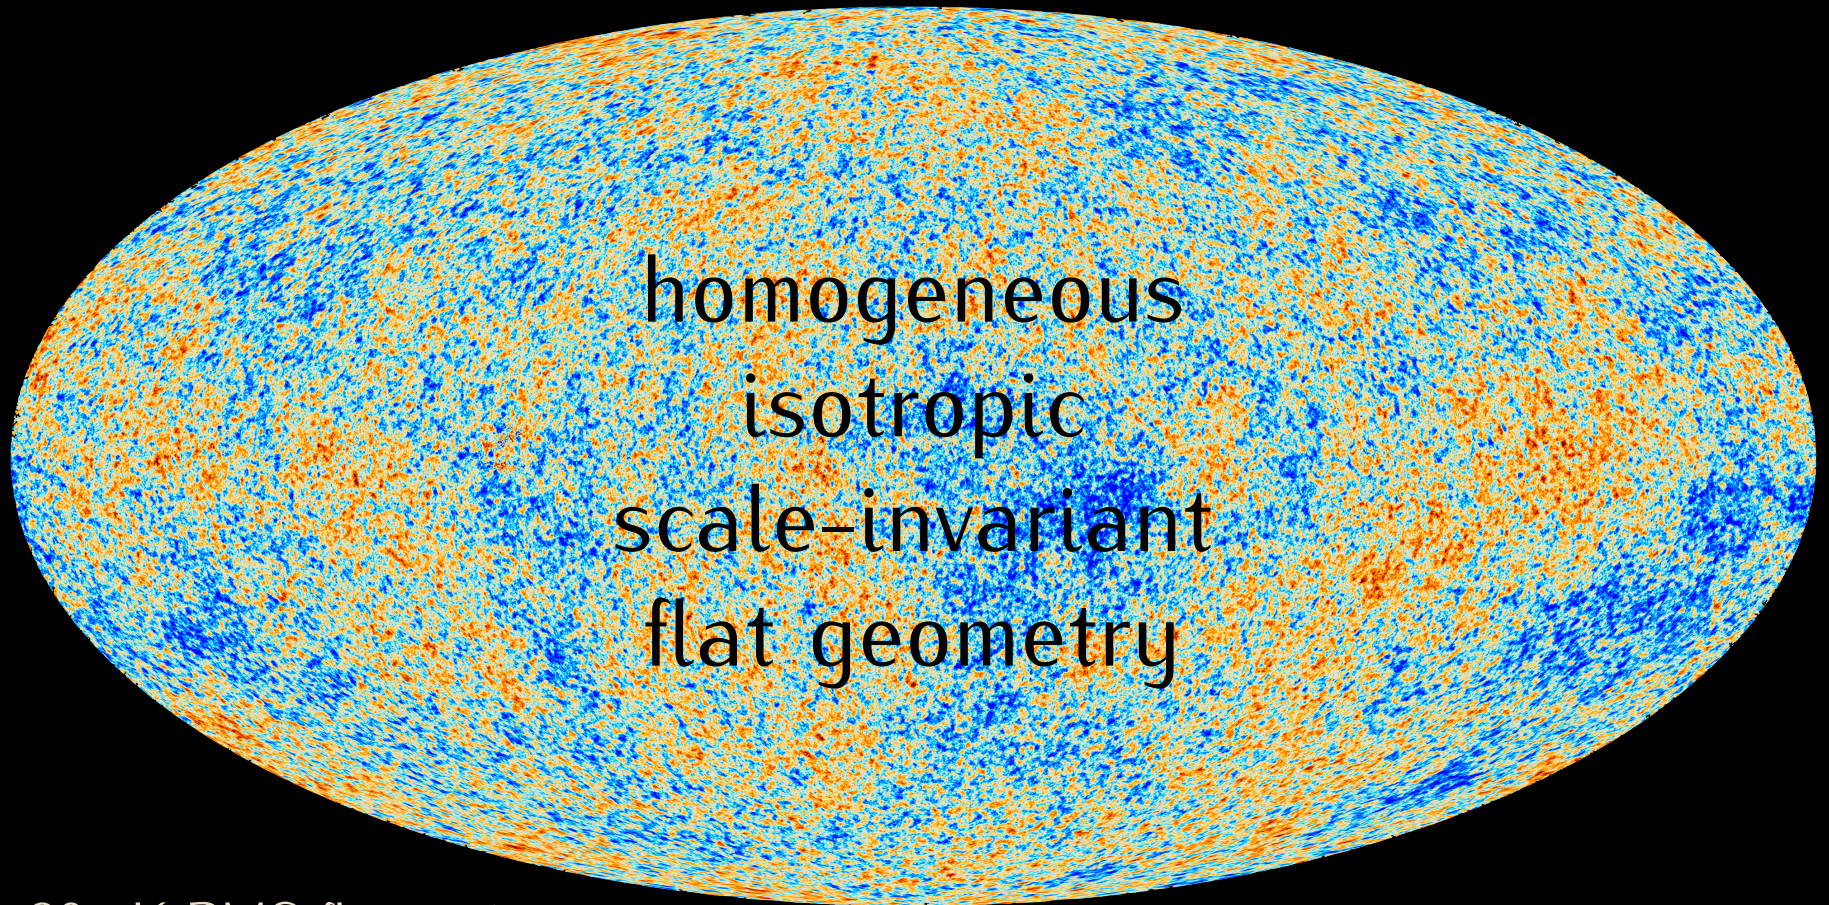

Alexandra Rahlin, Fermilab

# The History of the Universe

# The History of the Universe

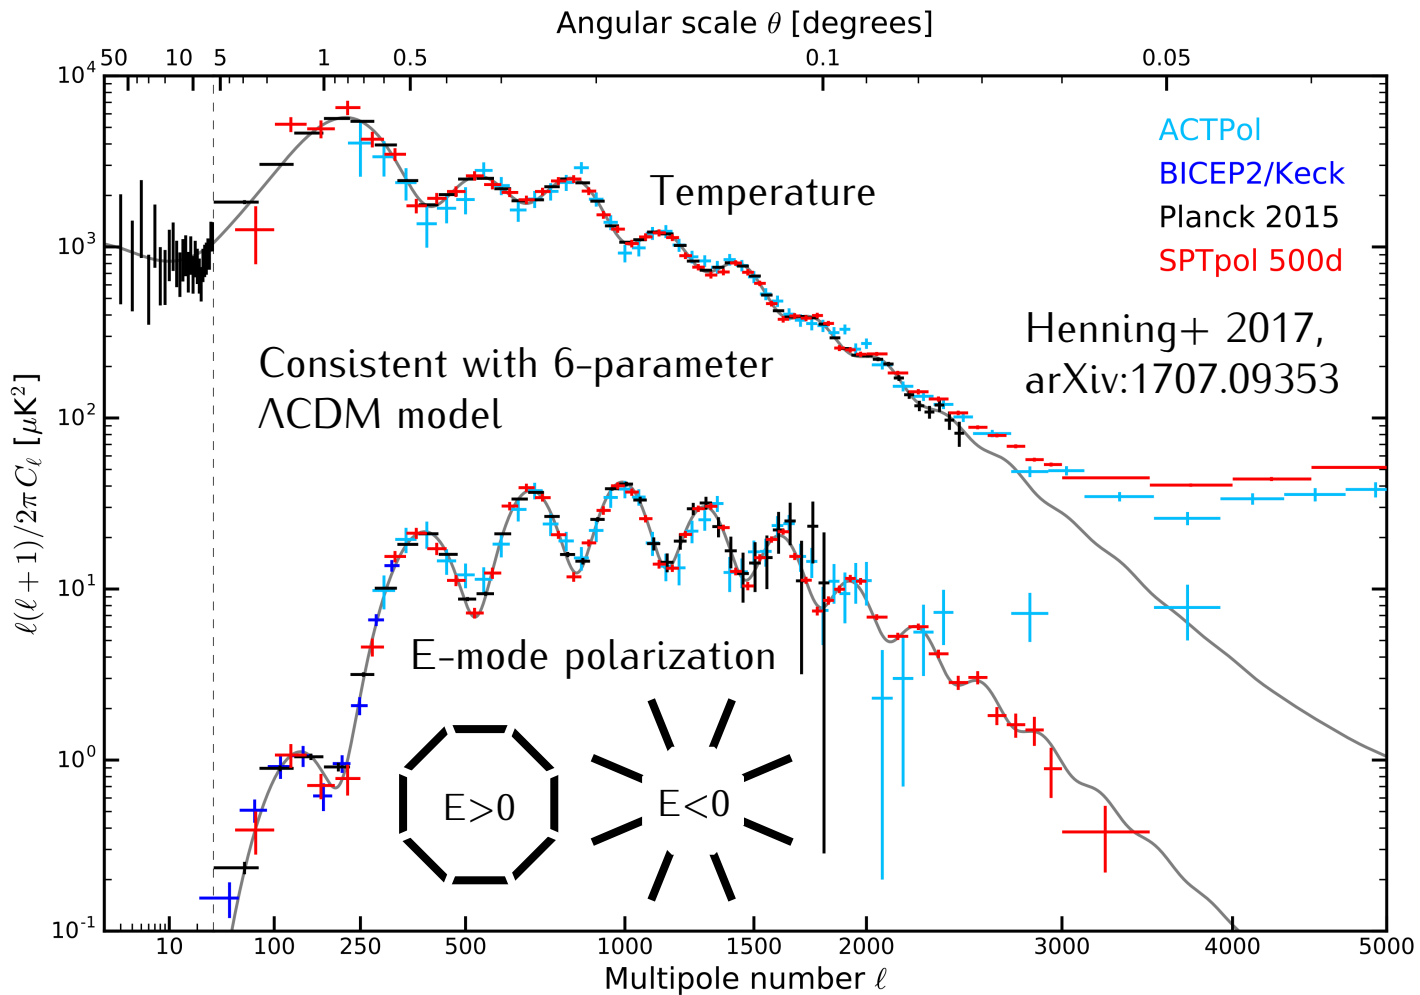

30  $\mu\text{K}$  RMS fluctuations  
on a 3 K background

# State of the Field

4

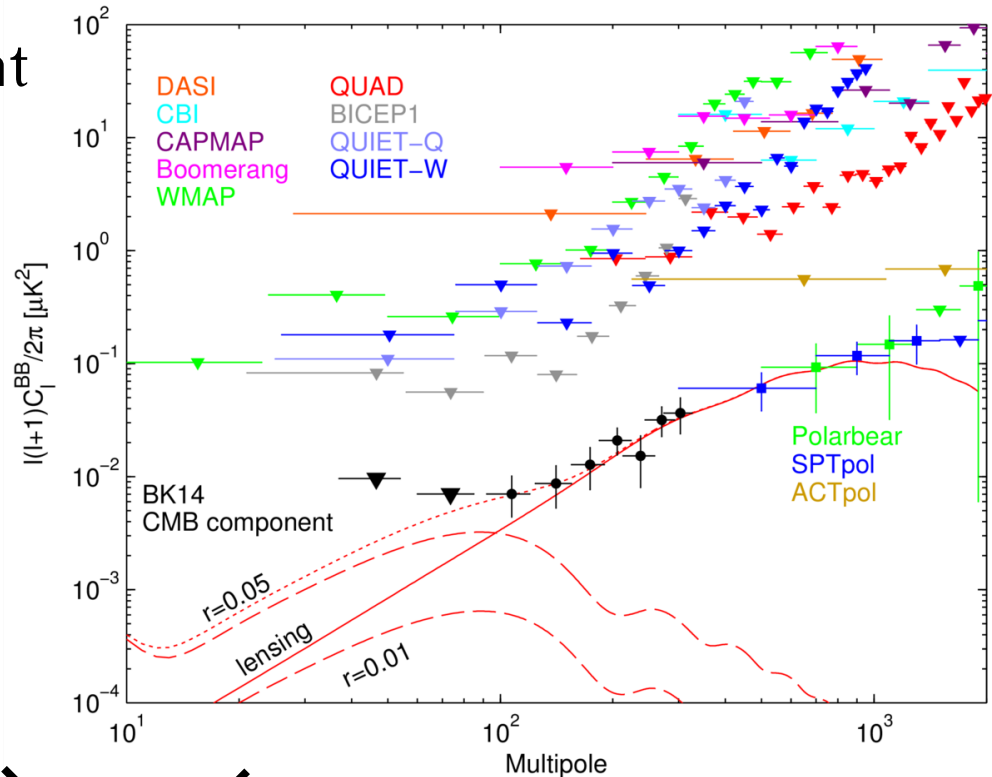

# State of the Field

Lensing B-mode consistent with expectations

Primordial B-mode limited to  $r < 0.09$  by BICEP2/Keck/Planck

Need high-fidelity measurements at large scales

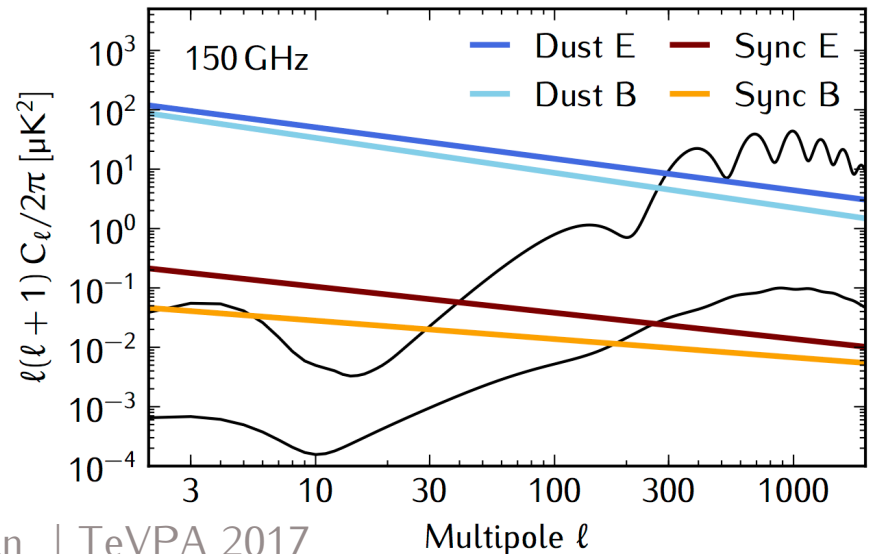

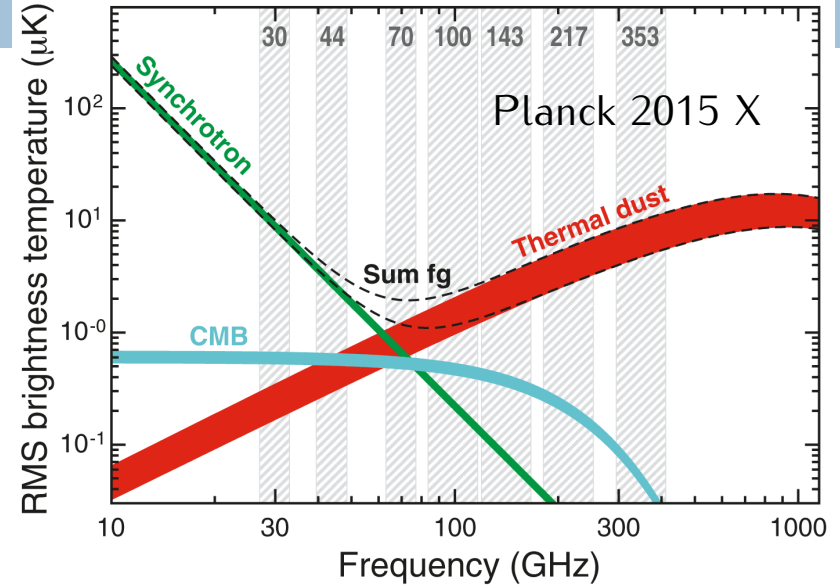

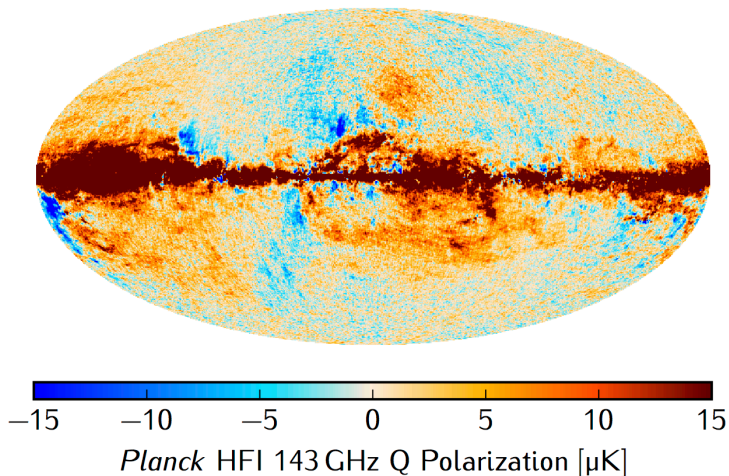

BK-VI, PRL 116, 2016

# Galactic Foregrounds

6

- Significant spatial variation
- Characteristic frequency spectrum
- Power law angular spectrum
- High-fidelity multi-frequency maps to disambiguate from CMB

# Ross Ice Shelf, Antarctica December 2014

# The SPIDER Instrument

8

Balloon-borne polarimeter designed to:

- Measure the angular power spectrum of the sky over a large area and a wide range of angular scales
- Separate the frequency and angular spectra of Galactic foregrounds
- Verify the statistical isotropy of the CMB component

**Goal: Limit or detect primordial B-modes**

# Flight Summary

9

- Launched January 1, 2015
- 16 days at float
- 1.6 TB data
- Data recovered, February 2015
- Hardware recovered November 2015
- Next flight December 2018

HC Chiang

# Sky Coverage

10

Planck  
COMMANDER

150 GHz Dust Polarization [ $\mu\text{K}_{\text{CMB}}$ ]

# System Overview

11

- 6 independent receivers
  - ▣ 3x 150 GHz, 3x 95 GHz
- A single cryogenic/vacuum environment
- Lightweight carbon fiber gondola
- Multi-axis pointing control and reconstruction
- Custom control electronics
- Lots of heritage from the BLAST program

# Receiver

12

- Cold refractive telecentric optics
- Well-controlled radiative loading:
  - ▣ External and internal baffling
  - ▣ Metal mesh filters
- Cold stepped HWP
- 300 mK focal plane
  - ▣ TES bolometers
  - ▣ Time-division multiplexed SQUIDs

# Performance Summary

13

	95 GHz	150 GHz
Bandwidth	22 GHz	36 GHz
Optical efficiency	30-45%	30-50%
Angular Resolution	41.1 arcmin	28.2 arcmin
Optical loading	< 0.25 pW	< 0.35 pW
# detectors (w/ cuts)	675	1188
Total NET	7.1 $\mu\text{K}\cdot\text{s}^{1/2}$	5.3 $\mu\text{K}\cdot\text{s}^{1/2}$

- Instantaneous NET near predictions
- Very conservative flagging for initial analysis
  - ▣ Flagging substantial due to thermal duty cycle, radio-frequency interference
- Observed < 0.3 pW loading, space-like conditions

# Maps

14

Stokes T/Q/U over  
~12% of the sky

NOT PUBLIC

# Maps

# SPIDER-2: December 2018

19

- 280 GHz receivers to characterize Galactic dust

Hubmayr et al, SPIE 2016

- Feedhorn-coupled OMTs, NET  $\sim 335 \mu\text{K-rts}$
- Designed to fit into existing receiver and electronics architecture

# SPIDER-2: December 2018

20

- 280 GHz receivers to characterize Galactic dust

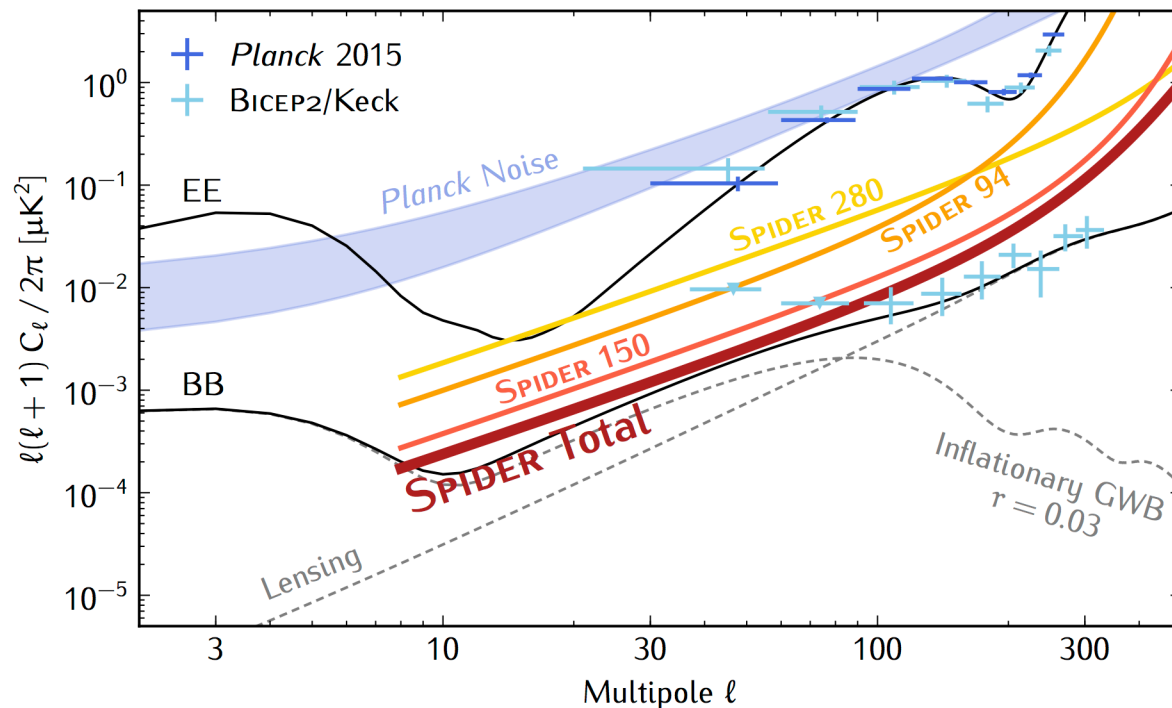

- Feedhorn-coupled OMTs, NET  $\sim 335 \mu\text{K-rts}$
- Designed to fit into existing receiver and electronics architecture

# SPIDER-2 Development

21

- 280 GHz receivers to characterize Galactic dust
- Expected sensitivity after two flights:

- SPIDER-1 successful
  - Space-like optical loading
  - Analysis in progress
- SPIDER-2 build underway
  - High frequency for dust
  - December 2018 launch

Thank you!
