Realizing late-time cosmology in the context of Dynamical Stability Approach

Wednesday 14 December 2022 16:00 (15 minutes)

Standard model of cosmology (Λ-CDM model) mainly suffers from two drawbacks, first one is the fine tunning problem and second one is a cosmic-coincidence problem. In this standard model of cosmology, Λ represents the cosmological constant and CDM denotes the cold-dark matter. Another important downside of the Λ-CDM model from the observational perspective is the discrepancy between the present observed value of Hubble' s constant and with predicted value of Hubble's constant from theory. These fundamental discrepancies motivate us to study different kinds of cosmological models based on the coupled field-fluid sectors. Based on these above considerations, we can build a theoretical framework for coupled field-fluid sector. Where field sector is made of a non-cannonical scalar field (k-essence sector) and the fluid sector is composed of pressureless dust. The nonminimal coupling term is introduced at the Lagrangian level. We employ the variational approach with respect to independent variables that produce modified k-essence field equations and the Friedmann equations. We have analyzed the coupled field-fluid framework explicitly using the dynamical system technique, considering two forms of the potential: constant and inverse power-law type. After examining these models it is seen that both models are capable of producing accelerating attractor solutions satisfying adiabatic sound speed conditions.

Session

Astroparticle Physics and Cosmology

Authors: CHATTERJEE, Anirban (Indian Institute of Technology Kanpur, India); BHATTACHARYA, Kaushik (Indian Institute of Technology, Kanpur); Mr HUSSAIN, Saddam (Indian Institute of Technology Kanpur)

Presenter: CHATTERJEE, Anirban (Indian Institute of Technology Kanpur, India)

Session Classification: WG1-Astroparticle Physics and Cosmology
