On the λ -extended class of the canonical transformations

Thursday 25 May 2017 17:45 (15 minutes)

A new type of canonical transformations for the multiplicative Hamiltonian, which considered as a 1-parameter: λ -extended class from the standard additive form of the Hamiltonian, was found and called λ -extended class of the standard canonical transformations. The λ -extended canonical transformations could be treated as a generating function to produce an infinite hierarchy of the 4 standard types of the canonical transforms.
