Fabrication, structure and magnetic properties of Ce_{1-x}Fe_xO₂ nanostructures

Monday 28 November 2016 11:25 (15 minutes)

Ce_{1-x}Fe_xO₂ nanofibers (NFs) and nanoparticles (NPs) ($x=0, 0.08$ and 0.10) were prepared by electrospinning and the simple solution process, respectively. Each of sample was calcined at 500, 600, 700, and 800 °C. The calcined samples were characterized by X-ray diffraction (XRD), Transmission Electron Microscopy (TEM), Scanning Electron Microscopy (SEM), X-ray Photoelectron Spectroscopy (XPS), X-ray Absorption Spectroscopy (XAS) and Vibrating Sample Magnetometer (VSM). Both of XRD and TEM with Selected Electron Diffraction (SEAD) analysis indicated that the Ce_{1-x}Fe_xO₂ nanostructures have a cubic structure without any secondary phase. TEM was shown nanofibers of ~30-60 nm while SEM was shown nanoparticles of ~9-40 nm. The as-spun samples were exhibited a diamagnetic behavior, whereas the calcined of Ce_{0.90}Fe_{0.10}O₂ nanofibers samples exhibited ferromagnetic behavior with the specific magnetizations of 0.04 – 0.32 emu/g at 10 kOe. XAS spectra was showed the valent state of mixed Fe³⁺ and Fe²⁺ in the Ce_{1-x}Fe_xO₂ samples indicating oxygen vacancies in the nanostructures. Similarly, XPS spectra confirmed that there are oxygen vacancies in the nanostructures. These oxygen vacancies play an important role to induce room temperature ferromagnetism (RT-FM) in the calcined of Ce_{1-x}Fe_xO₂ nanostructures. Our results indicated that the ferromagnetic properties of Ce_{1-x}Fe_xO₂ system is intrinsic and is not a result of any secondary magnetic phase or cluster formation.
