

Suppression and elliptic anisotropy of heavy flavor muons
in Pb+Pb collisions at $\sqrt{s_{NN}} = 2.76$ TeV

Miguel Arratia
for the ATLAS collaboration

Why study heavy quarks in nuclear collisions

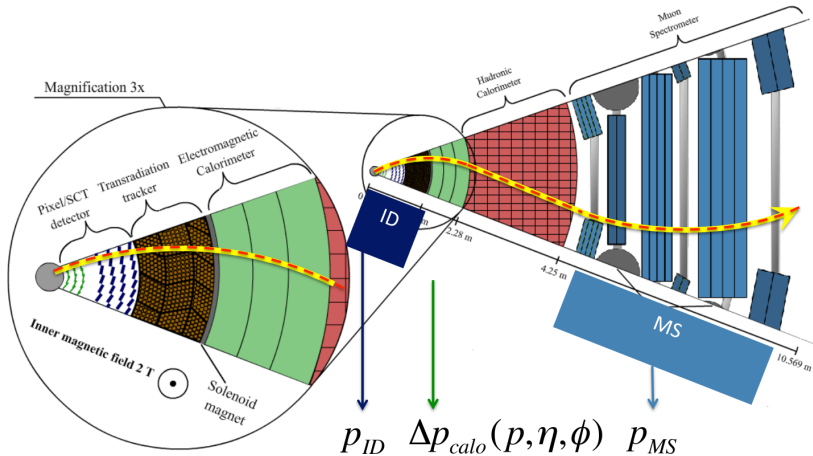

- Heavy quarks are probes for the hot and dense medium, energy loss, diffusion etc.
- To what extent do heavy quarks thermalize with the rest of the medium?

Measuring heavy quarks

- Muons from semi-leptonic decays of D and B hadrons
(THIS TALK)
- J/ψ from B hadron decays
- Fully reconstructed D and B hadrons
- b-jets, c-jets

Muon momentum measurement

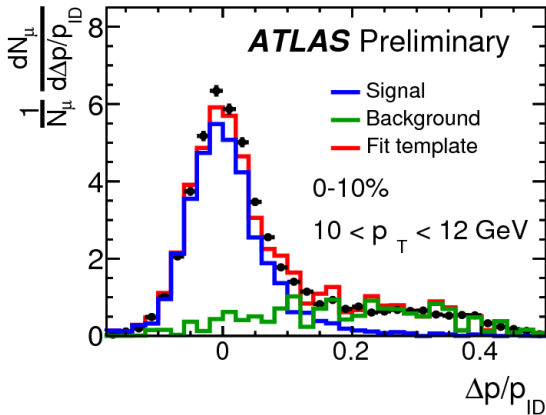

Discriminating variable = $(p_{ID} - \Delta p_{calo} - p_{MS}) / p_{ID}$

Background are muons from decays of flight from pions or kaons.

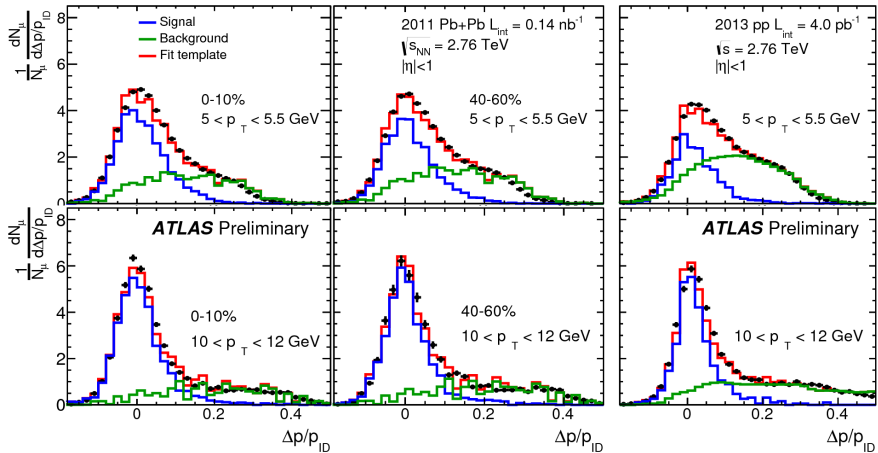

- Signal shape very different from background shape
- Little difference between pp and Pb+Pb templates

Signal Extraction

- Separate signal from background with a template fit

Signal Extraction

- Separate signal from background with a template fit in bins of centrality and muon p_T

Cross-section in pp collisions

$$\frac{d^2\sigma_{HF\mu}}{dp_T d\eta} = \frac{N_\mu}{\Delta p_T \Delta \eta} \frac{1}{\epsilon_{\text{trigger}} \epsilon_{\text{rec}}} \frac{1}{\mathcal{L}}$$

Yields in Pb+Pb collisions

$$\frac{1}{N_{\text{evt}}} \frac{d^2 N_{HF\mu}}{dp_T d\eta} = \frac{1}{N_{\text{evt}}} \frac{N_{\mu}}{\Delta p_T \Delta \eta} \frac{1}{\epsilon_{\text{trigger}} \epsilon_{\text{rec}}}$$

Nuclear suppression factor

$$R_{AA} = \frac{1}{\langle T_{AA} \rangle} \frac{\frac{d^2\sigma_{HF\mu}}{dp_T d\eta}}{\frac{d^2N_{HF\mu}}{dp_T d\eta}}$$

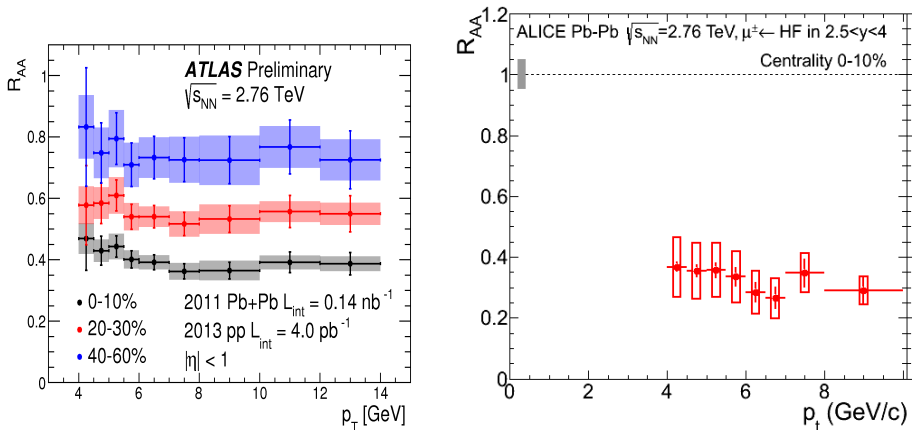

- Large suppression with respect to proton-proton collisions
- Suppression varies with centrality, reaching 0.4 for the most central collisions

Comparison with inclusive hadrons

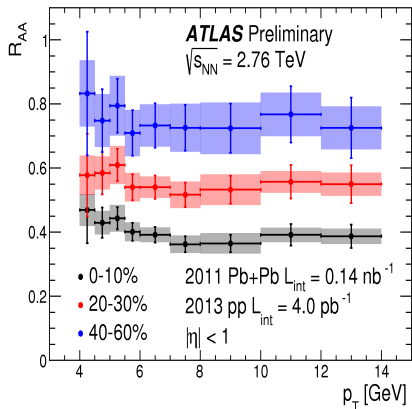

- More suppression of inclusive hadrons, ATLAS JHEP09(2015)050
- Much stronger momentum dependence for inclusive hadrons

Comparison with forward production

- Magnitude of suppression is compatible with ALICE measurement
Phys.Rev.Lett. 109 (2012) 112301
- Both experiments see no momentum dependence

Comparison with inclusive b-jets

- Compatible results between heavy flavour μ and b-jets
 PRL 113 (2014) 132301

Elliptic Flow

figure from <http://inspirehep.net/record/889692>.

ATLAS Liquid Argon Calorimeter

- Forward Calorimeter (FCAL) used to determine reaction plane

Heavy Ion Collision Event

ATLAS
EXPERIMENT

Azimuthal anisotropy

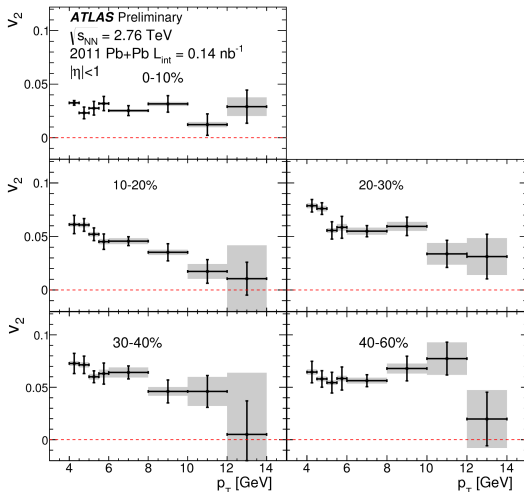

- Strong azimuthal anisotropy; **more muons in plane than out of plane**

Azimuthal anisotropy, different intervals

- Strong azimuthal anisotropy; **more muons in plane than out of plane**

Fourier elliptic term v_2 vs momentum

- Largest v_2 at the smallest measured p_T
- Non-zero v_2 even at highest p_T
- Highest amplitude at 10–40% centrality

Fourier elliptic term v_2 vs centrality

- Strong centrality dependence, similar across momentum intervals
- Highest momentum bin qualitatively different (large uncertainty)

Comparison with inclusive hadrons

- v_2 is smaller for muons than for inclusive hadrons
- Larger differences at lower p_T

Conclusions

ATLAS measured muons from heavy-flavor decays
in Pb+Pb and pp systems at $\sqrt{s_{NN}} = 2.76$ TeV

- Strong suppression that depends on centrality, reaches 0.4 at more central collisions
- At most weak momentum dependence
 - Very different from inclusive hadrons, ATLAS JHEP09(2015)050
 - Similar to b-jets , CMS PRL 113 (2014) 132301
 - Similar to measurements at forward rapidity, ALICE Phys.Rev.Lett. 109 (2012) 112301
- Strong anisotropy visible with strong momentum and centrality dependence
