Highlights from the HERMES experiment

Thursday 11 January 2018 16:30 (30 minutes)

The HERMES experiment collected from 1995 to 2007 a wealth of deep-inelastic scattering data using 27.6 GeV longitudinally polarized electrons and positrons and various unpolarized as well as longitudinally and transversely polarized gas targets. This allowed for a series of diverse measurements. Among them are measurements that provide information on the three-dimensional structure of the nucleon both in momentum space and in mixed momentum and position space. Results from HERMES on semi-inclusive deep-inelastic scattering, providing access to the three-dimensional quark distributions in momentum space, as well as on hard exclusive processes, sensitive to generalized parton distributions and thus to the three-dimensional nucleon structure in mixed momentum and position space, are presented and discussed.

Authors: VAN HULSE, Charlotte; ON BEHALF OF THE HERMES EXPERIMENT

Presenter: VAN HULSE, Charlotte

Session Classification: Parallel Session 4
