Simplified t-Channel Dark Matter

Universal framework for t-channel DM models [\[Arina,Fuks,Mantani \(2020\)\]](#)

S3M-uR t-channel Dark Matter

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + \mathcal{L}_{\text{kin,BSM}} + g_{\text{DM}} \bar{\chi}(u_R)_i (X^\dagger)_i + h.c.$$

$$\chi = (\mathbf{1}, \mathbf{1})_0 \quad X_i = (\mathbf{3}, \mathbf{1})_{2/3}$$

Simplified t-Channel Dark Matter

Universal framework for t-channel DM models [\[Arina,Fuks,Mantani \(2020\)\]](#)

S3M-uR t-channel Dark Matter

$$\mathcal{L} = \mathcal{L}_{\text{SM}} + \mathcal{L}_{\text{kin,BSM}} + g_{\text{DM}} \bar{\chi}(u_R)_i (X^\dagger)_i + h.c.$$

$$\chi = (\mathbf{1}, \mathbf{1})_0 \quad X_i = (\mathbf{3}, \mathbf{1})_{2/3}$$

- Discrete \mathcal{Z}_2 : SM fields even, dark sector fields odd
- 3 generation of mediator fields that couple democratically diagonally to the SM quarks
- Parameters: $(m_\chi = m_{\text{DM}}, \Delta m = m_X - m_{\text{DM}}, g_{\text{DM}})$

Dark Matter Freeze-Out

Assumptions during DM freeze-out:

- Dark sector in *kinetic* eq. with the SM.
- Dark sector particles in *chemical* eq. with themselves.

Coannihilation

$$\frac{dn}{dt} + 3Hn = -\langle \sigma_{\text{eff}} \mathbf{v} \rangle \left(n^2 - (n^{\text{eq}})^2 \right)$$

$$\langle \sigma_{\text{eff}} \mathbf{v} \rangle = \sum_{i,j} \langle \sigma_{ij} \mathbf{v}_{ij} \rangle \frac{n_i^{\text{eq}}}{n^{\text{eq}}} \frac{n_j^{\text{eq}}}{n^{\text{eq}}}$$

$$n = \sum_i n_i \quad \text{and} \quad i, j = \{\chi, X_1, X_2, X_3\} \quad \text{and} \quad \Omega_{\text{DM}} \sim \langle \sigma_{\text{eff}} \mathbf{v} \rangle^{-1}$$

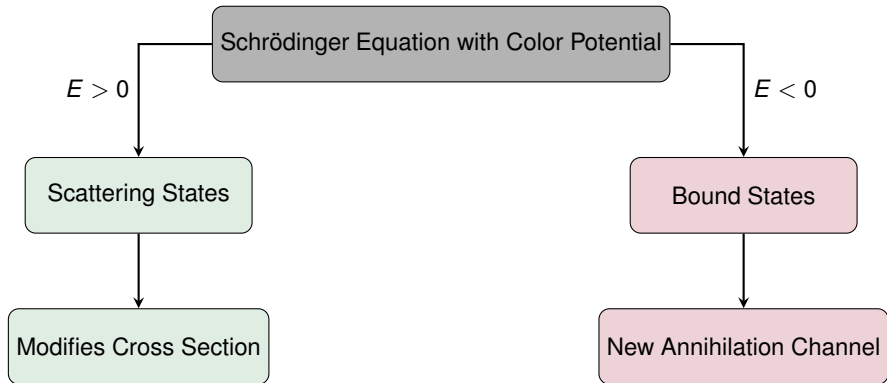

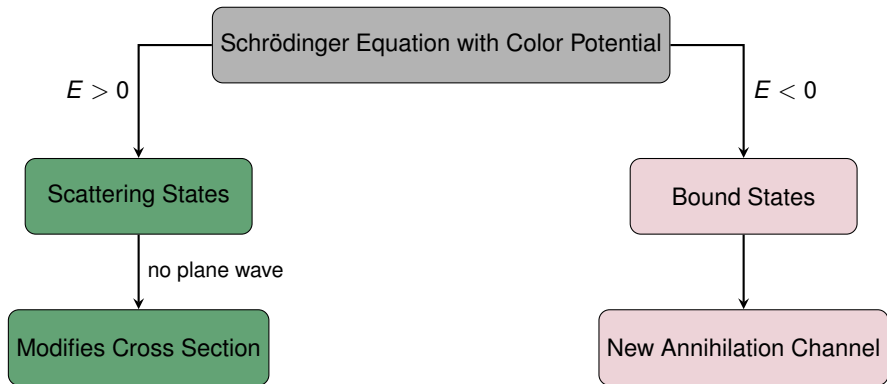

n -gluon exchanges contribute with $(\frac{\alpha}{v})^n$ for $\alpha \sim v$

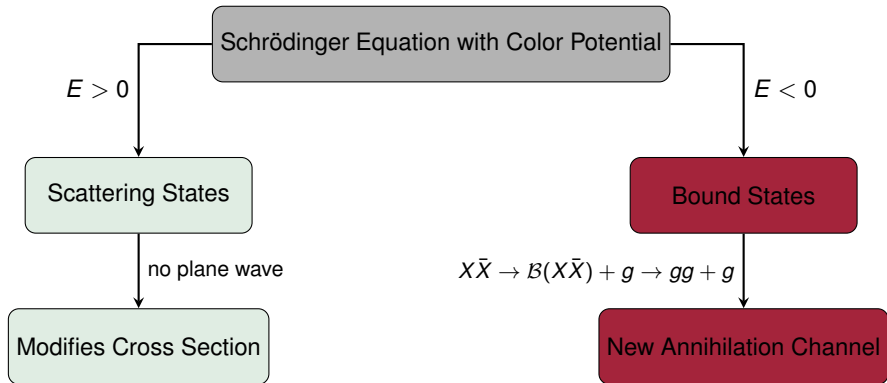

→ Resummation required since $\alpha \sim v$

→ Reduces to Schrödinger Equation for $v \ll 1$. For details [Petraki,Postma,Wiechers(2015)]

Figure from [Talk by J.Harz @ DM Working Group](#)

SE vs BSF

Modified Coannihilation [Ellis, Luo, Olive(2015)]

$$\langle \sigma_{\text{eff}} V \rangle = \sum_{i,j \in \{X, X\}} \langle S(\alpha/v_{ij}) \cdot \sigma_{ij} v_{ij} \rangle \frac{n_i^{\text{eq}}}{n^{\text{eq}}} \frac{n_j^{\text{eq}}}{n^{\text{eq}}} + \langle \sigma_{\text{BSF}} V \rangle_{\text{eff}} \left(\frac{n_X^{\text{eq}}}{n^{\text{eq}}} \right)^2$$

$\langle \sigma_{\text{eff}} V \rangle$	Sommerfeld Effect	Bound State Formation
$g_{\text{DM}} \gg g_s$	-	0
$g_{\text{DM}} \ll g_s$	+	+

Determine $g_{DM,0}$ for each data point $(m_{DM}, \Delta m)$ such that DM is *not* overproduced.

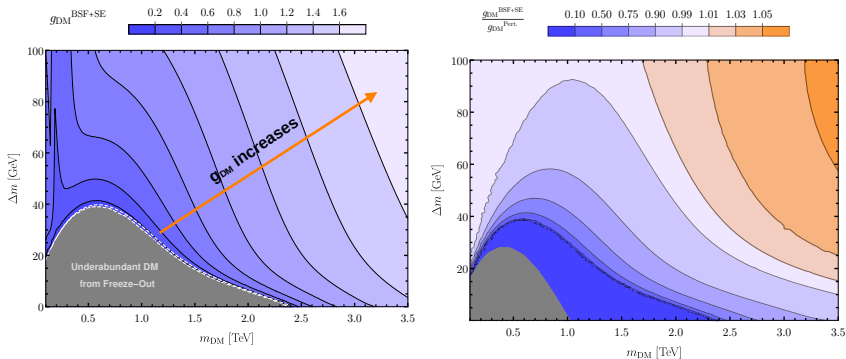

Figure from [MB,Copello,Harz,Mohan,Sengupta(2022)]

→ **Bound State Formation** increases the area where the strong interaction deplete relic density significantly!

Experimental Constraints

RGE improved Direct Detection [Mohan et. al (2019)]

mono-jet + ETmiss search by ATLAS

[arXiv:1711.03301]

multi-jets + ETmiss search by CMS

[arXiv:1704.07781]

$(m_{DM}, \Delta m) < (1 \text{ TeV}, 30 \text{ GeV})$ to $(1.4 \text{ TeV}, 40 \text{ GeV})$ (Sommerfeld Effect) and $(2.4 \text{ TeV}, 50 \text{ GeV})$ (Bound State Formation)

Bound State Formation at the LHC

Production Cross Section

$$\sigma(pp \rightarrow \mathcal{B}(XX^\dagger)) = \frac{\pi^2}{8m_{\mathcal{B}}^3} \Gamma(\mathcal{B}(XX^\dagger) \rightarrow gg) \mathcal{P}_{gg} \left(\frac{m_{\mathcal{B}}}{13 \text{ TeV}} \right)$$

→ try to observe the bound state resonance in $\gamma\gamma$ final state. [ATLAS \(2017\)](#)

Efficient for **all** g_{DM} small enough such that $\Gamma_X < E_B$, roughly speaking $g_{\text{DM}} \lesssim g_s$.

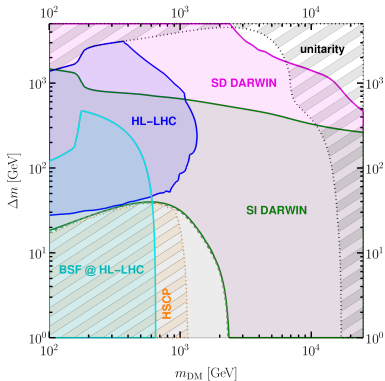

Sommerfeld Effect + Bound State Formation

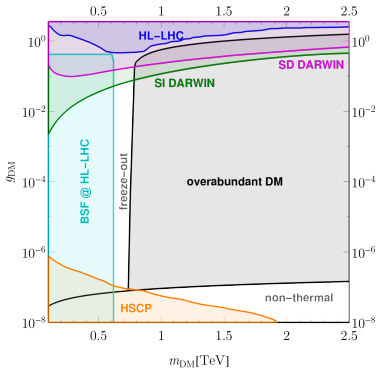

Limits at 37 fb^{-1} relatively weak in mass ($\sim 300 \text{ GeV}$)
 But huge potential: **Closes** the gap between prompt and LLP searches

Sommerfeld Effect+Bound State Formation

- Highly testable: Parameter space almost completely probed
- Remember: HSCP not a strict exclusion here (BSF@LHC is!)
- Bound State effects enlarge the area still necessary to test

Potential of BSF@LHC

Note: We fix $\Delta m = 0.05 m_{\text{DM}}$ here!

Conclusion

- Non-perturbative Effects can increase or decrease the annihilation cross section of DM
→ Cannot be handled by a flat correction factor!
- Non-perturbative Effects are non-negligible in scenarios of colored coannihilation and **open up** small mass parameter space:
Viable Parameter space shifts from $(m_{\text{DM}}, \Delta m) < (1 \text{ TeV}, 30 \text{ GeV})$ to $(1.4 \text{ TeV}, 40 \text{ GeV})$ (Sommerfeld Effect) and $(2.4 \text{ TeV}, 50 \text{ GeV})$ (Bound State Formation)
→ Sommerfeld Effect alone not a good approximation!
- Bound State searches at colliders close the gap in "coupling space" between prompt and long-lived-particle searches

Sommerfeld Effect

Sommerfeld Effect on the Annihilation Cross Section

$$\langle \sigma_{\text{eff}} v \rangle = \sum_{i,j \in \{X, \bar{X}\}} \langle S(\alpha/v_{ij}) \cdot \sigma_{ij} v_{ij} \rangle \frac{n_i^{\text{eq}}}{n^{\text{eq}}} \frac{n_j^{\text{eq}}}{n^{\text{eq}}}$$

Sommerfeld Factor

$$S(\alpha/v_{ij}) = \begin{cases} \geq 1 & , \text{ if } \alpha_{\text{eff}} > 0 (\text{attractive}), \\ \leq 1 & , \text{ if } \alpha_{\text{eff}} < 0 (\text{repulsive}) \end{cases}$$

- Has an effect independently of the hierarchy between g_{DM} and g_s
- Tends to lower $\langle \sigma_{\text{eff}} v \rangle$ for $g_{\text{DM}} > g_s$
- Tends to increase $\langle \sigma_{\text{eff}} v \rangle$ for $g_{\text{DM}} < g_s$

Bound State Formation (BSF)

Modified Coannihilation [Ellis,Luo,Olive(2015)]

$$\langle \sigma_{\text{eff}} V \rangle = \sum_{i,j \in \{X, X\}} \langle S(\alpha/v_{ij}) \cdot \sigma_{ij} v_{ij} \rangle \frac{n_i^{\text{eq}}}{n^{\text{eq}}} \frac{n_j^{\text{eq}}}{n^{\text{eq}}} + \langle \sigma_{\text{BSF}} V \rangle_{\text{eff}} \left(\frac{n_X^{\text{eq}}}{n^{\text{eq}}} \right)^2$$

Bound states effectively provide an additional annihilation channel.

Bound State Formation (BSF)

Modified Coannihilation [Ellis, Luo, Olive(2015)]

$$\langle \sigma_{\text{eff}} V \rangle = \sum_{i,j \in \{X, X\}} \langle S(\alpha/v_{ij}) \cdot \sigma_{ij} v_{ij} \rangle \frac{n_i^{\text{eq}}}{n^{\text{eq}}} \frac{n_j^{\text{eq}}}{n^{\text{eq}}} + \langle \sigma_{\text{BSF}} V \rangle_{\text{eff}} \left(\frac{n_X^{\text{eq}}}{n^{\text{eq}}} \right)^2$$

Bound states effectively provide an additional annihilation channel.

- BSF always increases annihilation cross section
- Purely mediated by g_s , thus less important for $g_{\text{DM}} \gg g_s$
