Gravitational Waves (GWs)

- Predicted by Poincaré (1905).  
This talk

Gravitational Waves (GWs)

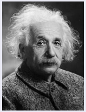
- Predicted by Poincaré (1905).  - Einstein provided a firm theoretical ground for them (1916).

$$\Box h_{\mu\nu} = -16\pi G T_{\mu\nu}$$

This talk

Gravitational Waves (GWs)



- Predicted by Poincaré (1905).
- Einstein provided a firm theoretical ground for them (1916).

$$\Box h_{\mu\nu} = -16\pi G T_{\mu\nu}$$

- First-order phase transitions in the Early Universe produce GWs. Witten (1984).

Gravitational Waves (GWs)

- Predicted by Poincaré (1905).  - Einstein provided a firm theoretical ground for them (1916).

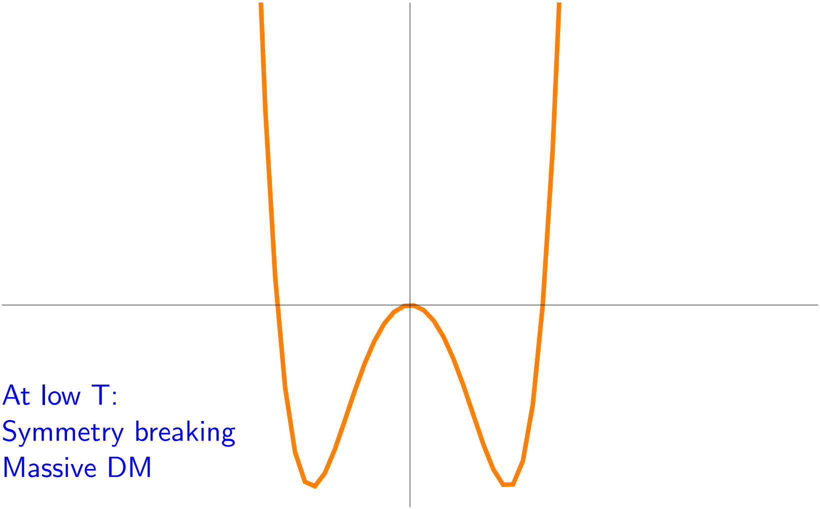
$$\Box h_{\mu\nu} = -16\pi G T_{\mu\nu}$$

- First-order phase transitions in the Early Universe produce GWs. Witten (1984).

This talk

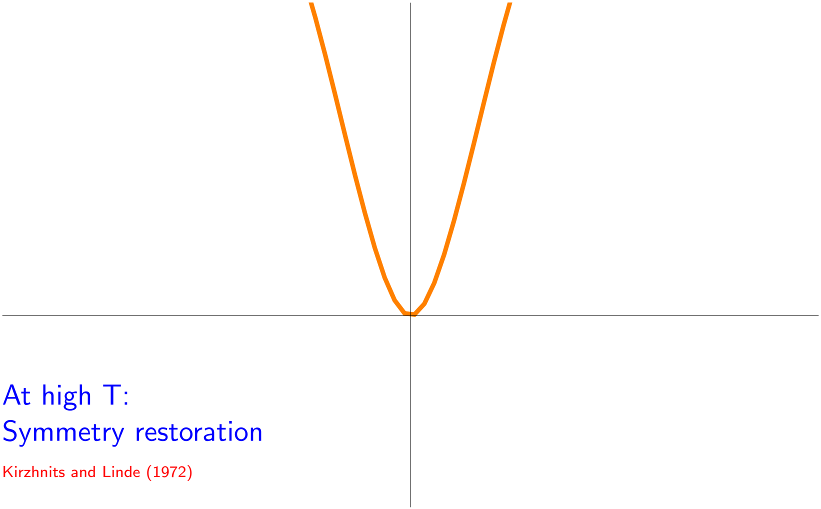
- Hypothesis: Dark matter are massive gauge bosons.
  $\rightarrow$There was a phase transition in the Early Universe: GWs.

First-order phase transition



At low T:
Symmetry breaking
Massive DM

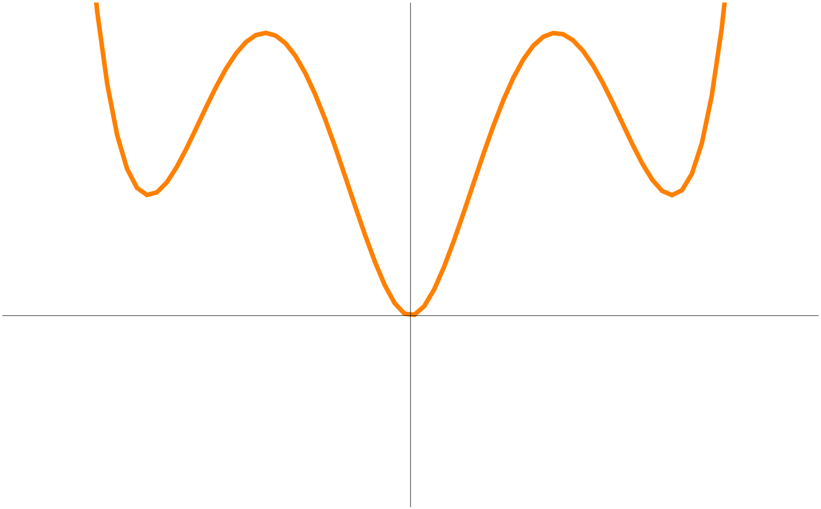
First-order phase transition



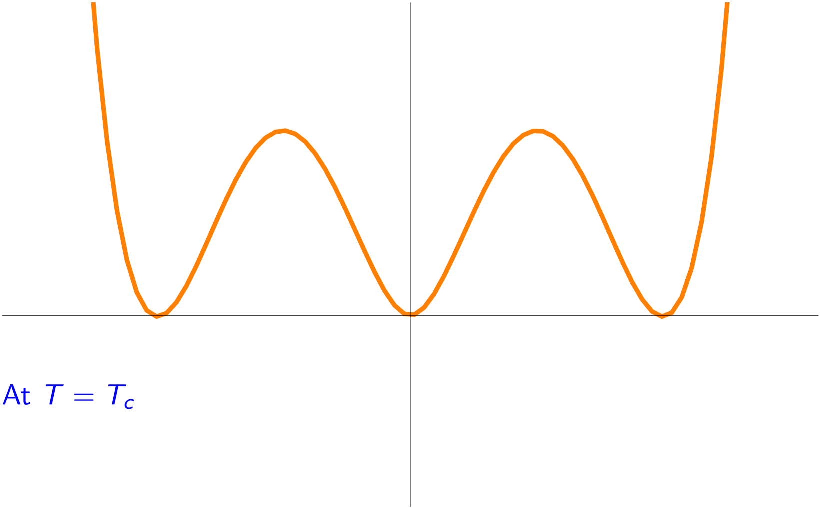
At high T:
Symmetry restoration

Kirzhnits and Linde (1972)

First-order phase transition

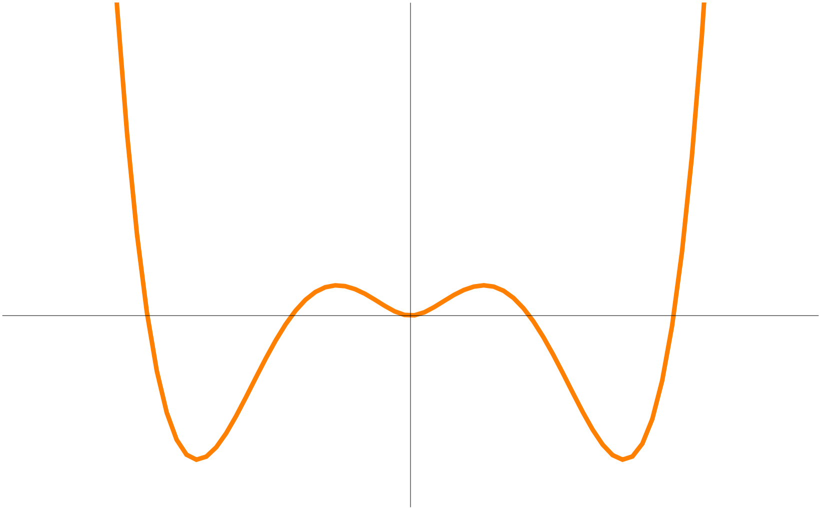


First-order phase transition

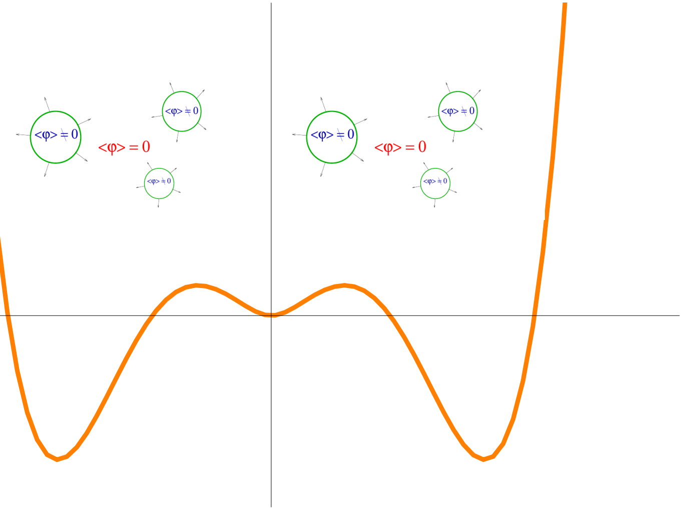


At $T = T_c$

First-order phase transition

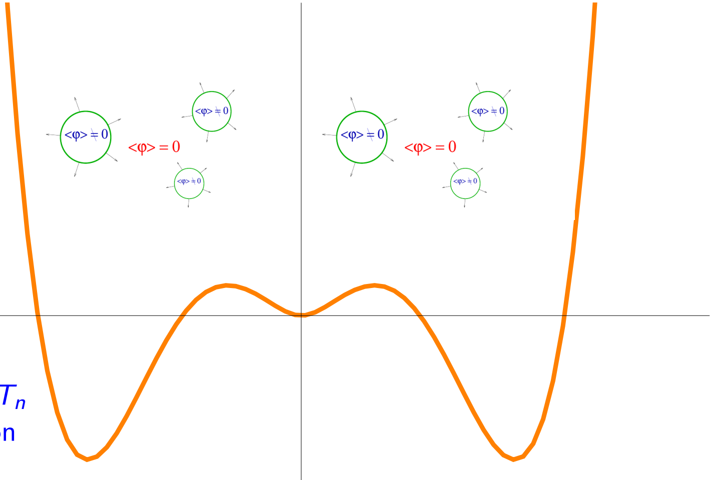


First-order phase transition



At $T = T_n$
nucleation

First-order phase transition



At $T = T_n$
nucleation

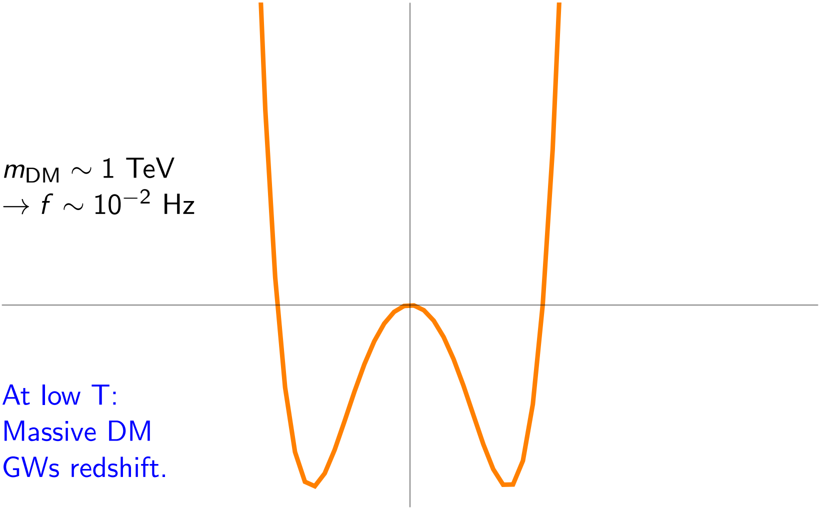
This produces produces gravitational waves E. Witten (1984)

First-order phase transition

At low T:
Massive DM
GWs redshift.

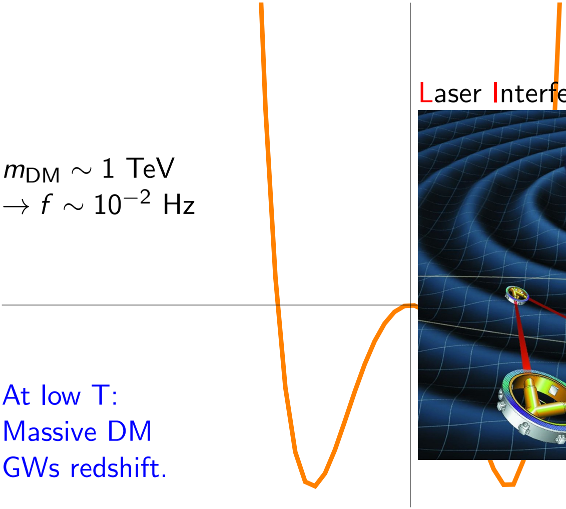
First-order phase transition

$m_{\mathrm{DM}} \sim 1$ TeV
$\rightarrow f \sim 10^{-2}$ Hz



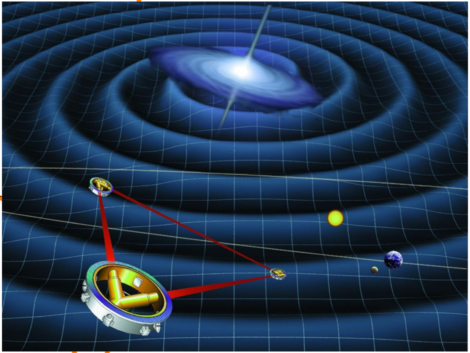
At low T:
Massive DM
GWs redshift.

First-order phase transition



$m_{\mathrm{DM}} \sim 1$ TeV
$\rightarrow f \sim 10^{-2}$ Hz

Laser Interferometer Space Antenna



At low T:
Massive DM
GWs redshift.

Caprini et al (2015)

Focus on a scenario based on a $SU(2)_D$ group

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 \, (H_D^\dagger H_D)^2 + \lambda_3 \, H_D^\dagger H_D \, H^\dagger H \, ,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ
Dark doublet H_D	$\rightarrow$	Higgs-like h_D

Hambye (JHEP 2009)

Focus on a scenario based on a $SU(2)_D$ group

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 (H_D^\dagger H_D)^2 + \lambda_3 H_D^\dagger H_D H^\dagger H \,,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$	
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ	Stable (DM Candidate)
Dark doublet H_D	$\rightarrow$	Higgs-like h_D	

Hambye (JHEP 2009)

Focus on a scenario based on a $SU(2)_D$ group

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 \, (H_D^\dagger H_D)^2 + \lambda_3 \, H_D^\dagger H_D \, H^\dagger H \, ,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$	
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ	Stable (DM Candidate)
Dark doublet H_D	$\rightarrow$	Higgs-like h_D	It mixes with the Higgs

Hambye (JHEP 2009)

Focus on a scenario based on a $SU(2)_D$ group

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 (H_D^\dagger H_D)^2 + \lambda_3 H_D^\dagger H_D H^\dagger H \,,$$

Local $SU(2)_D$ → Global $SO(3)$

Gauge Fields A'_μ → Massive Fields A_μ Stable (DM Candidate)

Dark doublet H_D → Higgs-like h_D It mixes with the Higgs

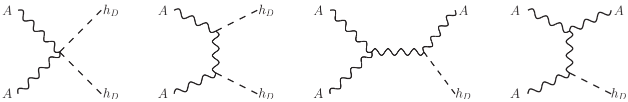
High temperatures → Low temperatures

Hambye (JHEP 2009) Phase transition in the Early Universe!!!!!!!!!!!

Four parameters

- DM mass
- Higgs-like mass
- mixing angle. Direct detection in Xenon1T: $\theta \lesssim 0.1$.
- vev (or g_D) are set by the relic density (via freeze-out):

$$\begin{cases} g_D \approx 0.9 \times \sqrt{\frac{m_A}{1\,\mathrm{TeV}}} \\ v_\eta \approx 2.2\,\mathrm{TeV} \times \sqrt{\frac{m_A}{1\,\mathrm{TeV}}}. \end{cases}$$



GW spectrum

Phase transition parameters

$T_n = 0.48\ \text{TeV}$

$\eta_n = 3.8\ \text{TeV}$

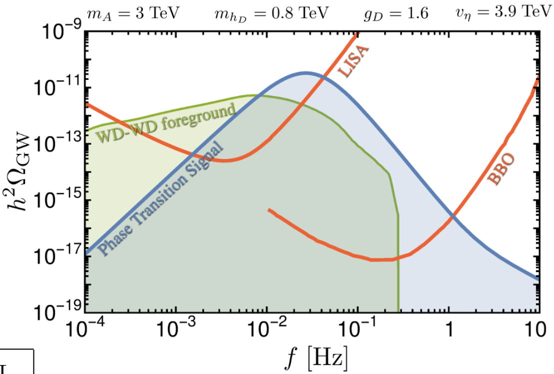
$\alpha = 0.29$, ~(latent heat)

$\beta/H = 290$ ~(fq. scale)

Simulations give Ω_{GW} from them

Caprini et al (2015)

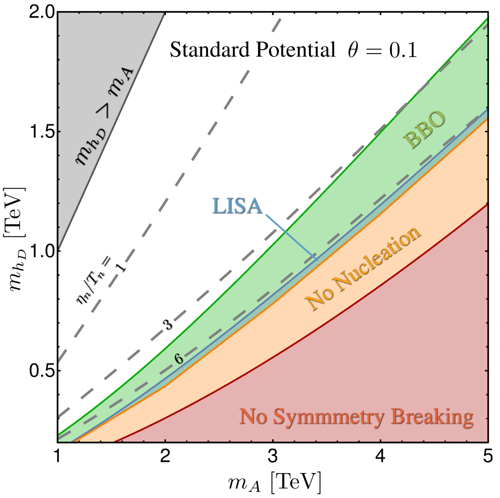
	SNR	SNR_{FGL}
LISA	15	1.8
BBO	3.7×10^5	2.3×10^3



Baldes, CGC 2018

Parameter space for SNR>5.

$$\mathrm{SNR} = \sqrt{t_{\rm obs} \int \left[\frac{h^2\Omega_{\rm GW}(f)}{h^2\Omega_{\rm sens}(f)}\right]^2 df}$$



Baldes, CGC 2018

Dark matter as massive dark gauge bosons

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 (H_D^\dagger H_D)^2 + \lambda_3 H_D^\dagger H_D H^\dagger H \,,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ
Dark doublet H_D	$\rightarrow$	Higgs-like h_D

Dark matter as massive dark gauge bosons

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

Set them to zero (Classically scale invariant potential) Hambye,Strumia,Teresi (2013,2018)

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 (H_D^\dagger H_D)^2 + \lambda_3 H_D^\dagger H_D H^\dagger H ,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ
Dark doublet H_D	$\rightarrow$	Higgs-like h_D

Dark matter as massive dark gauge bosons

Field	$SU(3)$	$SU(2)$	$U(1)_Y$	$SU(2)_D$
H	1	2	$\frac{1}{2}$	1
H_D	1	1	0	2

Set them to zero (Classically scale invariant potential) Hambye,Strumia,Teresi (2013,2018)

$$V = \mu_1^2 H^\dagger H + \mu_2^2 H_D^\dagger H_D + \lambda_1 (H^\dagger H)^2 + \lambda_2 (H_D^\dagger H_D)^2 + \lambda_3 H_D^\dagger H_D H^\dagger H \,,$$

Local $SU(2)_D$	$\rightarrow$	Global $SO(3)$
Gauge Fields A'_μ	$\rightarrow$	Massive Fields A_μ
Dark doublet H_D	$\rightarrow$	Higgs-like h_D

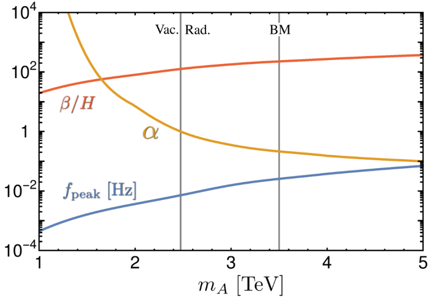
Radiative effects break the $SU(2)_D$ symmetry Coleman-Weinberg (1973)
λ_2 runs to negative values.

Baldes, CGC 2018

- Only one free parameter after taking the relic density into account.
- Scale-invariant potential $\rightarrow$ strong signal.

Baldes, CGC 2018

- Only one free parameter after taking the relic density into account.
- Scale-invariant potential → strong signal.



Baldes, CGC 2018

- Only one free parameter after taking the relic density into account.
- Scale-invariant potential $\rightarrow$ strong signal.

Conclusions

- We have explored the possibility of DM from a hidden $SU(2)_D$ gauge group. This implies a phase transition that will result in detectable gravitational waves.
- The model is therefore well suited as a case study for the sensitivity of future gravitational wave observatories to phase transitions in DM sectors.

Conclusions
