Searching for atmospheric Dark Matter

Tuesday 8 June 2021 11:00 (20 minutes)

An interesting possibility of producing relativistic dark matter is via cosmic-ray collisions. In this talk, I will discuss the production of dark matter in cosmic-ray air-showers, which are generated in the collision of cosmic-rays with the earth's atmosphere. I will also discuss the potential of neutrino detectors for constraining this atmospheric dark matter within the context of the vector portal.
