Neutron star radial oscillations with Delta Baryons

Wednesday, July 26, 2023 2:25 PM (25 minutes)

Employing the density-dependent relativistic mean-field model, we investigate the effect of delta baryons on the radial oscillations of neutron and hyperon stars. A unified approach is employed to calculate the baryon-meson coupling constants for the spin-1/2 baryonic octet and the spin-3/2 decuplet. By solving the Sturm-Liouville boundary value problem and verifying its validity, we calculate the 20 lowest eigenfrequencies and related oscillation functions of delta-admixed nuclear ($N\Delta$) and hyperonic matter ($NH\Delta$).

We see that the presence of the delta and hyperonic admixtures causes the lowest mode frequencies for $N+\Delta$ and $N+H$ EoSs to be higher than those for the pure nucleonic matter [1]. With the inclusion of hyperons and Δ s, the distance between succeeding modes also increases.
