

19th International Conference on QCD in Extreme Conditions (XQCD 2023)

Contribution ID: 84

Type: **Talk**

Inhomogeneous meson condensation

Friday 28 July 2023 11:30 (25 minutes)

The meson condensed phase is an interesting portal on the properties of QCD in a regime in which various methods, including lattice QCD, are reliable.

We discuss inhomogeneous topologically nontrivial configurations of the pion fields in the framework of chiral perturbation theory.

Solitons characterized by a nonvanishing topological charge naturally emerge. These states that can be identified with baryons surrounded by a bath of pions, meaning that the system has an effective nonvanishing baryonic density.
