Probing hybrid stars and the properties of the special points with radial oscillations

Wednesday 26 July 2023 19:35 (25 minutes)

We study the properties of hybrid stars containing a color superconducting quark matter phasevin their cores, which is described by the chirally symmetric formulation of the confining relativistic density functional approach. It is shown that depending on the dimensionless vector and diquark couplings of quark matter, the characteristics of the deconfinement phase transition are varied, allowing us to study the relation between those characteristics and mass-radius relations of hybrid stars. Moreover, we show that the quark matter equation of state can be nicely fitted by the AlfordBraby-Paris-Reddy model that gives a simple functional dependence between the most important parameters of the EOS and microscopic parameters of the initial Lagrangian. Based on it, we analyze the special points of the mass-radius diagram in which several mass-radius curves intersect. To find a distinguishable observational characteristic of the stars with the same mass and radius in the special points and probe their interior composition we calculate the frequencies of the fundamental mode of radial oscillations.
