

Extragalactic Science with CTA

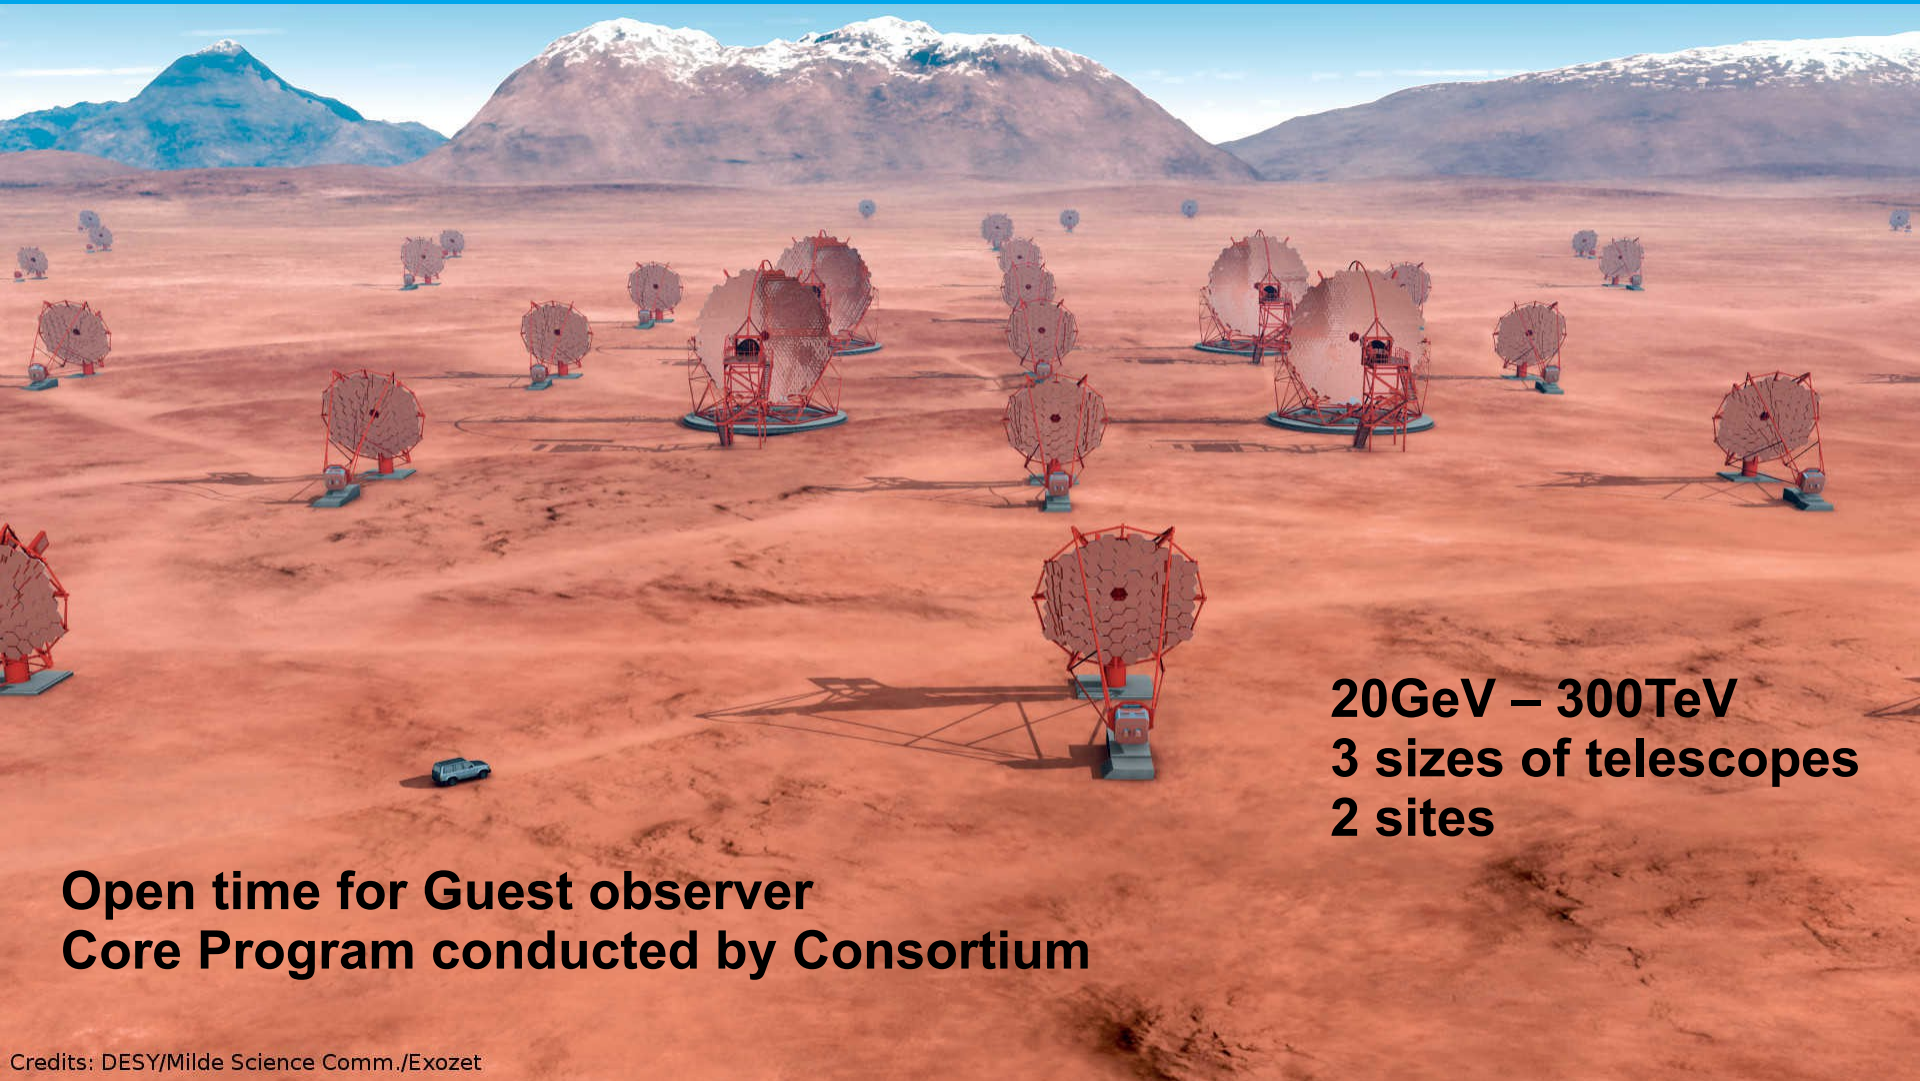

Key Science Projects

Lucie Gérard
for the CTA Consortium

16-12-2015

CTA: Very High Energy Gamma-Ray Observatory

20GeV – 300TeV
3 sizes of telescopes
2 sites

Open time for Guest observer
Core Program conducted by Consortium

Credits: DESY/Milde Science Comm./Exozet

See Michael Daniel's Talk: Thursday 14:00 (Session 20)

Understanding the Origin and Role of the Relativistic Cosmic Particles
Probing Extreme Environments
Exploring Frontiers in Physics

CTA Key Science Projects

Extragalactic KSPs

Theme	Question	Dark Matter Programme	Galactic Centre Survey	Galactic Plane Survey	LMC Survey	Extra-galactic Survey	Transients	Cosmic Ray PeVatrons	Star-forming Systems	Active Galactic Nuclei	Galaxy Clusters
Understanding the Origin and Role of Relativistic Cosmic Particles	1.1 What are the sites of high-energy particle acceleration in the universe?		✓	✓✓	✓✓	✓✓	✓✓	✓	✓	✓	✓✓
	1.2 What are the mechanisms for cosmic particle acceleration?		✓	✓	✓		✓✓	✓✓	✓	✓✓	✓
	1.3 What role do accelerated particles play in feedback on star formation and galaxy evolution?		✓		✓				✓✓	✓	✓
Probing Extreme Environments	2.1 What physical processes are at work close to neutron stars and black holes?		✓	✓	✓			✓✓		✓✓	
	2.2 What are the characteristics of relativistic jets, winds and explosions?		✓	✓	✓	✓	✓✓	✓✓		✓✓	
	2.3 How intense are radiation fields and magnetic fields in cosmic voids, and how do these evolve over cosmic time?					✓	✓			✓✓	
Exploring Frontiers in Physics	3.1 What is the nature of Dark Matter? How is it distributed?	✓✓	✓✓		✓						✓
	3.2 Are there quantum gravitational effects on photon propagation?						✓✓	✓		✓✓	
	3.3 Do Axion-like particles exist?					✓	✓			✓✓

Extragalactic Key Science Projects

> Targeted Observations

- **Active galactic nuclei:** VHE physic of AGN, cosmology, UHECRs, fundamental physic.
- **Transients:** follow up on GRBs and extragalactic transients
- **Galaxy clusters:** deep observation to probe cosmic rays in clusters

> Extragalactic Survey

- **Unbiased survey of $\frac{1}{4}$ of the extra-galactic sky:** for population study and duty cycle, new and unknown sources.

VHE extragalactic sky as of today

- > 67 sources. Strongly biased (most observations motivated by flux level at other wavebands)
- > Mostly blazars, 4 radio galaxies, 5 FSRQs, 2 star burst galaxies

Active Galactic Nuclei KSP

- > What are the relevant particle acceleration and emission processes?
- > How are the different blazar types related?
- > What causes the observed variability?
- > Where does the VHE emission from radio-galaxies come from?
- > Is there other classes of AGNs emitting gamma-rays?
- > What is the spectrum of the EBL and how does it evolves with redshift?
- > What is the strength of the IGMF?
- > Are AGNs a source of UHECRs?
- > What can we say about Lorentz invariance violation?

Active Galactic Nuclei KSP: Variability

> Long term variation:

- Duty cycle?
- Quasi periodicity? *
- Break in the power spectra?

> Short term variation:

- Size, location and nature of the emission region?
- Acceleration and cooling mechanisms?

Flare of blazar PKS 2155-304 (2006)

H.E.S.S. data

Aharonian et al. 2007 (ApJ 664L 71A)

Simulated CTA observations

Sol et al. 2013 (APh 43 215S)

* see Stamerra et al., Hughes et al., Mendoza et al., this conference

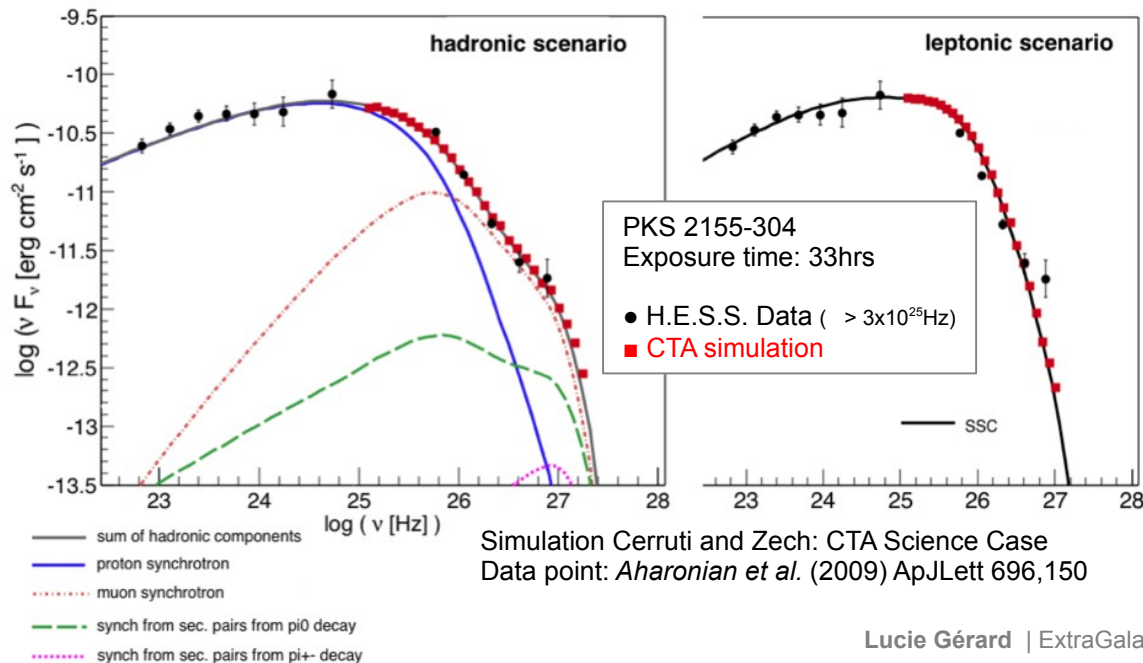

Active Galactic Nuclei KSP: Spectra

> High-frequency peaked blazars:

- Leptonic or hadronic origin of the emission?
- Signature of the interaction of gamma-ray with the photon fields?
- Separate intrinsic features from propagation effects (wide range of redshift and source classes)

> Radio galaxies:

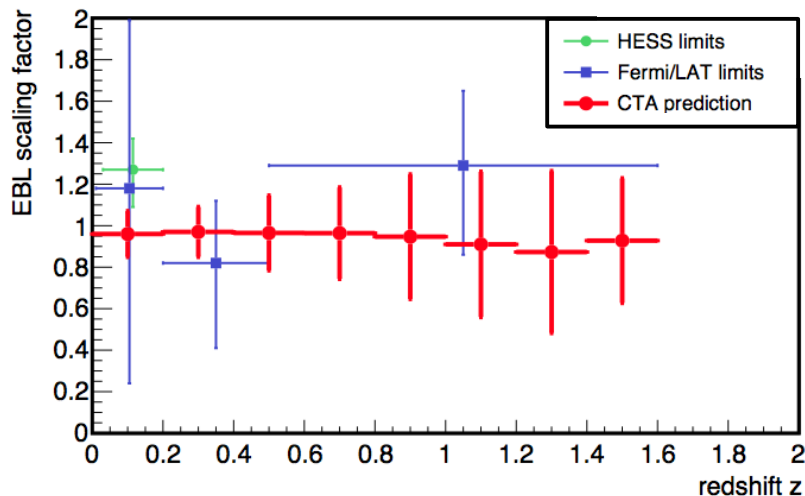

- Where is the VHE emission coming from?
- Does it fit the unification schemes? What is the link with blazars?

Active Galactic Nuclei KSP: Probing the Universe

> Extra-galactic background light:

- Measurement from mid UV to far infrared with precision 20%
- Evolution up to redshift $z > 1$
- Measurement of the cosmic γ -ray horizon
- Measurement of the Hubble constant

Simulation D. Mazin (CTA Science Case)

> Inter-galactic magnetic fields:

- Lower limit or detection?
- Imaging analysis:
“pair halos” (IGMF $> 10^{-16}$ G)
- Time resolved spectra:
“pair echoes” (IGMF $< 10^{-16}$ G)

Elyiv et al. 2009 (Phys. Rev. D. 80,2)

Active Galactic Nuclei KSP: Strategy

> Long-term monitoring program

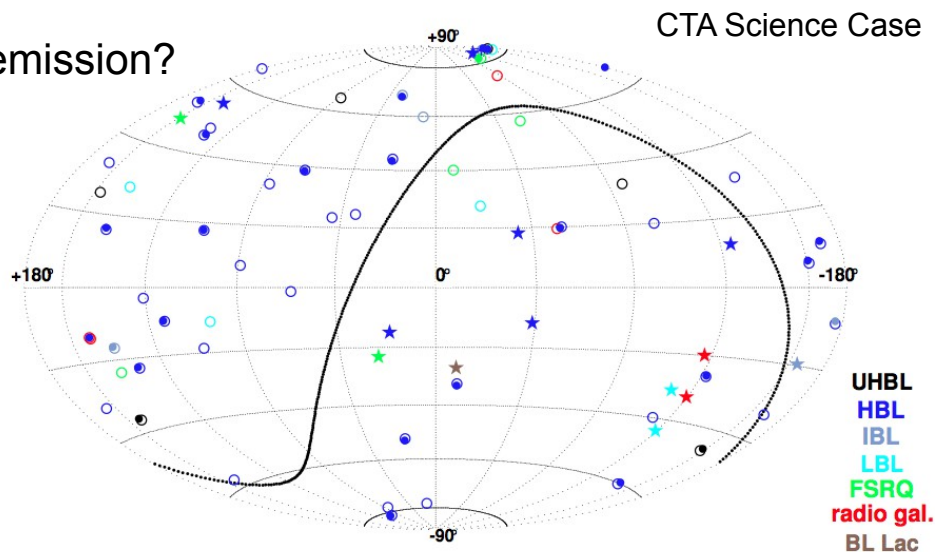

- Regular observation of 15 VHE AGN of different classes
- Goal: Light curves over 10 years minimum and time resolved spectra

> High Quality spectrum program

- 40 AGNs of different classes with redshifts between 0.02 and 1.11
- Goal: uniform set of high quality spectra
- Deep observation of two radio galaxies
- Goal: high resolution spectra, extended emission?

> Flare program

- Follow up of external triggers
- Regular monitoring of 80 AGNs of different classes and different redshifts
- Goal: Catching flares

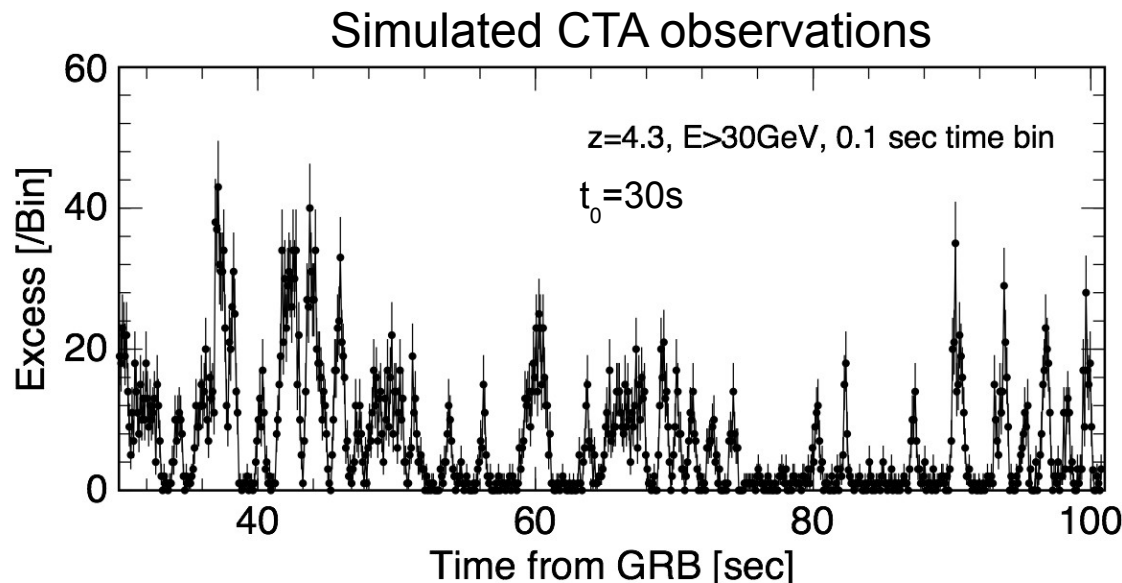

Transients: Focusing on GRBs

- > What is the jet Lorentz factor?
 - > What can we say about the emission site based on $\gamma\gamma$ absorption and rapid variability?
 - > Probing particle emission and radiation for the prompt emission and the after glow.
 - > Probing EBL, IGMF and LIV
- > Follow up on all promising GRBs

LST repositioning 20s

Serendipitous detection
More likely with a bigger FoV
Divergent pointing?

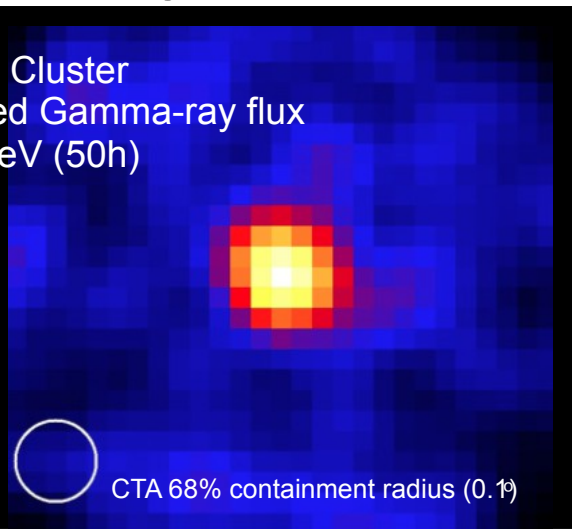

Inoue et al. 2013 (APh 43,252)

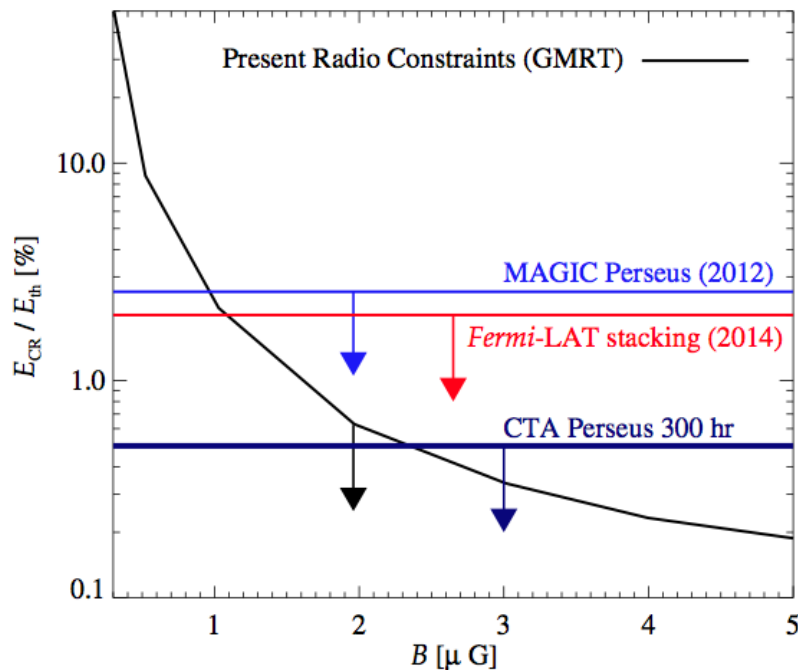

Clusters of galaxies KSP

- Probing the origin, acceleration and propagation of CRs in clusters
- If detected: spectral and spatial distribution of diffuse component
- If not detected:
 - Hadronic origin of diffuse radio emission is ruled out
 - Limits on AGN injection of protons
- Prime target for DM searches
- Deep observation of the Perseus cluster
- Multi-purpose target:
 - NGC 1275 and IC 310 in FoV
- With full CTA array

Perseus Cluster
Simulated Gamma-ray flux
> 100 GeV (50h)

CTA Science Case

Brunetti et al. (2007). *ApJ*, 670, L5
 Aleksic et al. (2012). *A&A*, 541, A99
 Ackermann et al. (2014). *ApJ*, 787, 18
 CTA Science Case

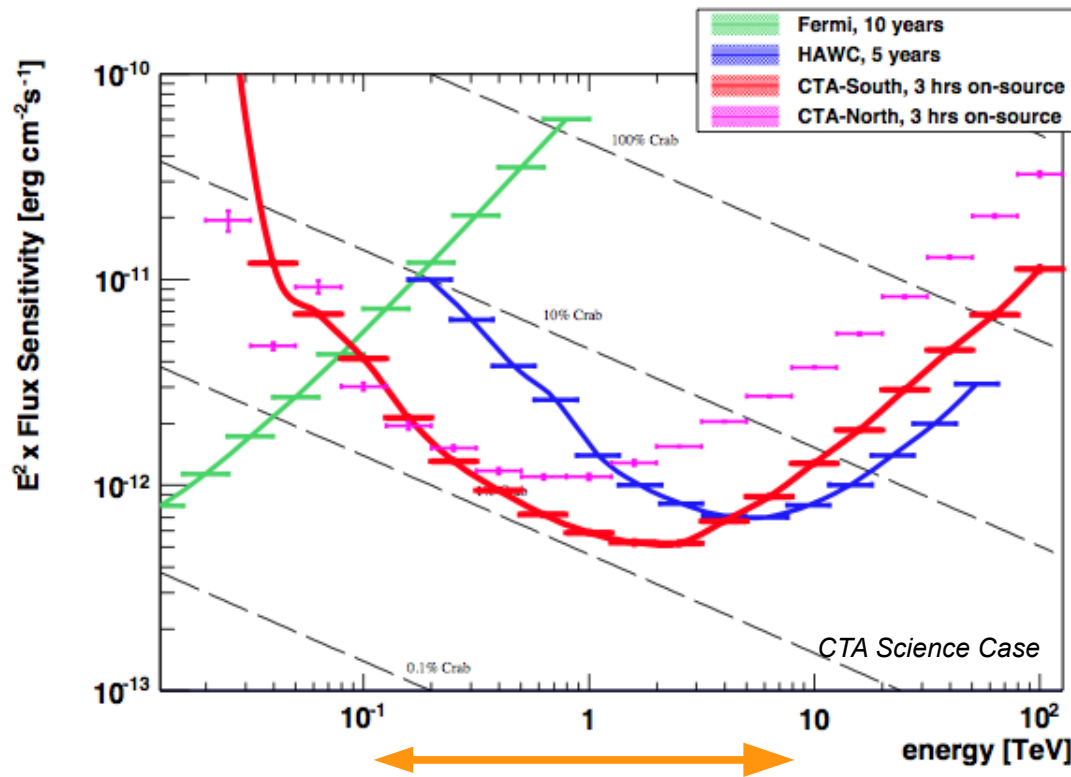

Extragalactic survey KSP

➤ Unbiased survey of ¼ of the extragalactic sky (10 000deg²)

- Unbiased catalogue of the VHE extragalactic sources
- High resolution map between 50GeV and 10TeV

CTA FoV ~150 deg²

- 1000h
- Sensitivity 4-7mCrab
- Both sites
- CTA full array
- Completed within 3 years

Unique survey in 100GeV-10TeV energy range

Extragalactic survey KSP: AGN physics

- Measurement of the nearby ($z < 0.2$) BL Lacs luminosity function
 - Need at least 50 sources and an unbiased sample
 - 30-150 foreseen detections from Fermi or UV-Xray extrapolations
- Goal:
 - Probing the AGN unification scheme and the Blazar sequence
 - Estimate of the extragalactic diffuse gamma-ray background

Arsioli et al. (2015). arXiv:1504.02801 (top)
CTA Science case

Padovani P. & P. G. (2015). MNRAS 446L 41P

Extragalactic survey KSP: other benefits

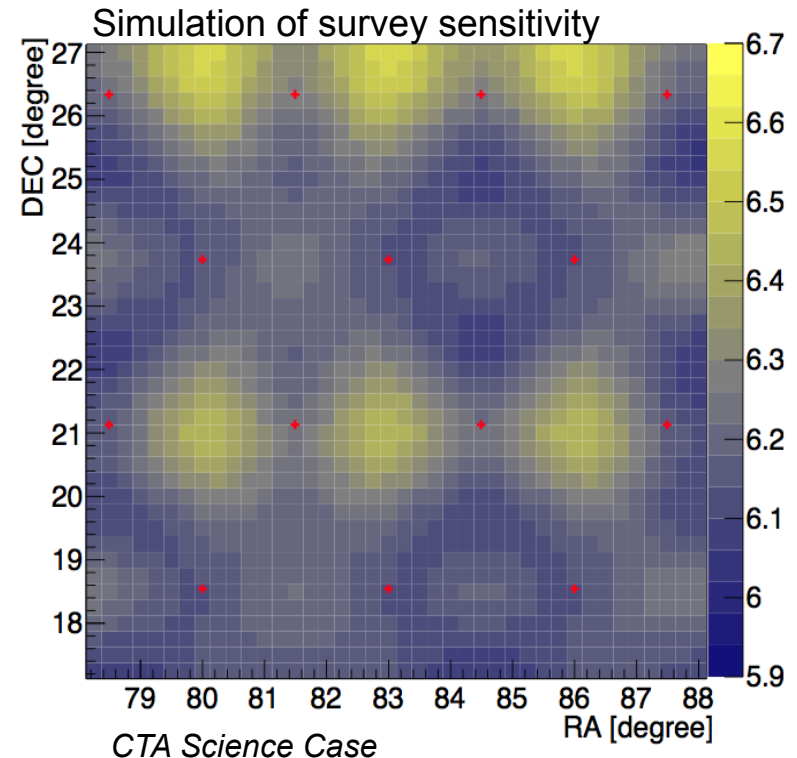

- > Reveal extreme blazars useful for EBL and IGMF studies
- > New sources and new sources classes
 - Radio galaxies, star burst galaxies?
 - Clusters of galaxies, Seyfert 2 galaxies, ULIRGs?
 - Dark sources, signature of new physics?
- > Large scale anisotropy of the electron spectrum

Proposed extragalactic survey

Extragalactic survey KSP: Strategy

- > Uniform exposure $\sim 6\text{mCrab}$ of 25% of the sky
- > Each part of the sky observed several times to average over the sources activity states
- > Several highly interesting regions covered (Virgo and Coma clusters, Northern Fermi bubble, Cen A)
- > Serendipitous discovery during construction will be used to refine the strategy

Divergent pointing preliminary studies suggest:

- factor 4 increase in full array FoV
 - factor 2 degradation in energy and angular resolution
 - potential gain in sensitivity for same survey observation time
- Very interesting for transient searches (GRBs in prompt phase?)

Multi-wavelength and multi-messenger support

- > MWL follow up on transients: AGNs and active sources
- > MWL long term monitoring campaigns targets
- > Complete coverage of the extragalactic survey (at least optical)
- > MWL and MM agreements and MoUs for alerts
- > Redshift campaigns for blazars

- > Possibility of CTA dedicated optical telescopes
(photometry and polarimetry)
 - Systematic coverage of the targets to identify high and low states of the sources
 - Monitoring of AGNs for alerts of flaring states

Data products and release

> AGNs:

- Continuous on line release of light curves and alerts from flaring monitored sources.
- Regular release of full data set
- Catalogue after first year and final catalogue and maps

> Transients:

- Release of spectra and light curves for detected transients
- Upper limits for all observed GRBs
- Alerts

> Galaxy clusters:

- Release of a preliminary and later final map and data

> Extragalactic survey:

- Continuous release of alerts for transients events
- Catalogue

All CTA data will be released to the public after the proprietary period (1 year)

Summary

- > Extragalactic KSPs explore CTA science themes in a coherent manner
- > Data release to public after proprietary time (1 year)
- > Strong Guest Observer program with ~50% of observing time over the first 10 years
- > Legacy of use for the entire astronomical community
 - Catalogues
 - Maps
 - Light curves
- > The KSPs will evolve according to the reviews before and during CTA operational period.
