# A stiff Higgstory of the Universe

*Monday 14 December 2015 16:35 (20 minutes)*

I will present the cosmological implications of the decay of the Standard Model Higgs after Inflation, when assuming a post-inflationary/pre-BBN expansion history driven by a stiff source with equation of state  $w > 1/3$ . In particular, I will discuss first the realisation of a successful 'reheating' mechanism, and secondly, the production of a large background of gravitational waves by the Higgs decay products.
