Formation of millisecond pulsars and double neutron stars

Monday 7 December 2015 16:15 (30 minutes)

Radio millisecond pulsars (MSPs) have been spun-up to very high rotation frequencies via accretion of mass and angular momentum from a companion star in a binary system. In this talk, I will review the formation of MSPs and discuss recent observational and theoretical challenges in understanding their formation and evolution via the standard recycling scenario. I will discuss MSP properties like spin periods, masses and orbital characteristics, and also briefly discuss new developments related to our understanding of the formation of double neutron star systems.
