CEMP Stars as Probes of First-Star Nucleosynthesis, the IMF, and Galactic Assembly

Contribution ID: 85

Type: Oral contribution

Seeking the origin of CEMP-r/s stars

Tuesday 10 September 2019 11:10 (20 minutes)

The elemental abundances in many metal-poor stars show enhancements of carbon and as well neutroncapture elements: CEMP-s, CEMP-r and CEMP-r/s stars. In several radial velocity (RV) projects we have tried to uncover the origin of CEMP stars with enhancements of s- and/or r-process elements. The orbital elements of those that are binaries seem to give hints about the origin of the enhancements. Radial-velocity monitoring of CEMP-s stars has shown that these are primarily found in binary systems, and gained their sprocess abundances via mass transfer as their companion evolved through the asymptotic giant branch phase. The source of neutron-capture elements of the CEMP-r/s stars is not well constrained. We now monitor a sample of CEMP-r/s stars for radial-velocity variations to determine the binary frequency of a sample of CEMP-r/s stars and determine orbital parameters for the binary systems.

Authors: Prof. NORDSTRÖM, Birgitta (Niels Bohr Institute, Copenhagen, denmark); Dr THIDEMANN HANSEN, Terese (Texas University, USA)

Presenter: Prof. NORDSTRÖM, Birgitta (Niels Bohr Institute, Copenhagen, denmark)

Session Classification: OBSERVATIONAL APPROACH: CEMP STARS, FIRST STARS, FIRST GALAX-IES
