# First Glashow Resonance Event at IceCube

Bull. Am. Astron. Soc. 51, 185 (2019)

- ▶  $\mathcal{O}(100)$  upgoing tracks and HESE events
- ▶ Glashow resonance: cross section enhancement from on-shell  $W^-$  production
- ▶  $\sigma \propto \frac{1}{(E-E_0)^2 + \Gamma^2}$ ,  $E_0 = \frac{M_W^2}{2m_e} \approx 6.3 \text{ PeV}$

- ▶  $\bar{\nu}_e$  in the astrophysical flux  $\implies$  way to distinguish  $\nu$  from  $\bar{\nu}$
- ▶ PeV partially contained events: shower with energy of  $6.05 \pm 0.72 \text{ PeV}$
- ▶  $\mathcal{O}(\text{PeV})$  cosmic muon as BKG yields  $10^{-7}$  events  $\implies$  rejected at  $5\sigma$

Nature 591, 220–224 (2021)

S. Glashow, Phys. Rev. 118, 316

# First Neutrino Interaction Candidates at LHC

- ▶  $\text{FASER}\nu$  is a 1.2 tonne detector located 480 m from the ATLAS interaction point containing emulsion films and tungsten plates

- ▶  $\text{FASER}\nu 2$  will be a 10 tonne detector at FPF

- ▶ 2018 Pilot Run with 29 kg target during LHC Run 2
- ▶ background-only hypothesis is disfavored at  $2.7\sigma \Rightarrow$  hint for  $\nu$ -N scattering events

## “Glashow-like” Events at Low Energies?

# “Glashow-like” Events at Low Energies?

$$\bar{\nu}_e e^- \rightarrow R^-$$

- ▶ electrically charged
- ▶ no baryon number
- ▶ no lepton number

$W^-$  works but **mesons as well!**

$$s = 2E_\nu m_e \sim \text{GeV}^2$$

- ▶ there are many GeV-scale charged mesons

# “Glashow-like” Events at Low Energies?

$$\bar{\nu}_e e^- \rightarrow \text{meson} \rightarrow \text{anything}$$

Breit-Wigner: 
$$\sigma_{\text{res}} = (2J + 1)8\pi \Gamma^2 \text{Br}_{\text{in}} \text{Br}_{\text{fi}} \frac{s/M^2}{(s - M^2)^2 + M^2\Gamma^2}$$

- ▶ pseudoscalar mesons:  $\Gamma(\text{m} \rightarrow \bar{\nu}_e e^-) = \frac{G_F^2}{8\pi} f^2 m_{\text{lep}}^2 M \left(1 - \frac{m_{\text{lep}}^2}{M^2}\right) |V_{\text{CKM}}|^2$
- ▶ vector mesons:  $\Gamma(\text{m} \rightarrow \bar{\nu}_e e^-) = \frac{G_F^2}{12\pi} f^2 M^3 |V_{\text{CKM}}|^2$

$$\bar{\nu}_e e^- \rightarrow \rho^- \rightarrow \pi^0 \pi^-$$

$$E_{\nu}^{\text{res}}(\rho^-) = \frac{(770\text{MeV})^2}{2m_e} \approx 580 \text{ GeV}$$

$$E_{\nu}^{\text{res}}(K^{*-}) \approx 780 \text{ GeV}$$

- ▶ alternative calculation using  $\langle \pi^-(k_1) \pi^0(k_2) | V_{\mu} | 0 \rangle = (k_1 - k_2)_{\mu} F(q^2)$

# Event Rates

Experiment	$\rho^-, \pm\Gamma/2$	$\rho^-, \pm 2\Gamma$	$K^{*-}, \pm\Gamma/2$	$K^{*-}, \pm 2\Gamma$
FASER $\nu$	0.3	0.5	–	–
FASER $\nu/2$	23	37	0.7	3
FLArE-10	11	19	0.3	2
FLArE-100	63	103	2	8
DeepCore	3 (1)	5 (2)	–	–
IceCube	8 (40)	17 (83)	–	–

$$R_W = \frac{\sigma(\bar{\nu}_e e^- \rightarrow \text{hadrons})}{\sigma(\bar{\nu}_e e^- \rightarrow \bar{\nu}_\mu \mu^-)}$$

$$R = \frac{\sigma(e^+ e^- \rightarrow \text{hadrons})}{\sigma(e^+ e^- \rightarrow \mu^+ \mu^-)}$$

# Signature of $\rho^-$ Resonance

- ▶ cut on  $E_{\pi^-} + E_{\pi^0}$  to lie near 580 GeV
- ▶  $\theta_{\nu N} \sim 1/\gamma_{\text{cm}} \sim 28 \text{ mrad} \times \sqrt{600 \text{ GeV}/E_\nu}$  for **deep inelastic scattering**
- ▶  $\theta_{\pi\pi} = 28 \text{ mrad} \sqrt{m_e/m_N} \times \sqrt{600 \text{ GeV}/E_\nu} = 0.7 \text{ mrad} \times \sqrt{600 \text{ GeV}/E_\nu}$  for  $\bar{\nu} - e$  scattering
- ▶ cut on charged track and photon multiplicity
- ▶ reconstruct the invariant mass of the  $\pi^0\pi^-$  pair,  $m_{\pi\pi}^2 = m_{\pi^0}^2 + m_{\pi^-}^2 + E_{\pi^0}E_{\pi^-} - \theta_{\pi\pi}^2$ , and require it to lie within  $\Gamma_\rho \sim 150 \text{ MeV}$  of  $m_\rho \approx 770 \text{ MeV}$

- ▶ Sweeper Magnet for FASER $\nu$ 2

## IceCube:

- ▶ large background and difficult to identify  $\pi^-\pi^0$  topology
- ▶ S : B  $\approx$  1 : 100

# Signature of $\rho^-$ Resonance at FLArE

- ▶ given  $\mathcal{O}(\text{mrad})$  angular resolution  $\pi^-$  track and  $\gamma\gamma$  would overlap
- ▶ nevertheless, efficient PID using  $dE/dx$  can be employed
  - (i) for the first 10 cm or so only the  $\pi^-$  will be visible
  - (ii) the emitted photons will not appear until only  $\mathcal{O}(10)$  cm down the track where each of the  $\gamma$  will convert to  $e^+e^-$  pair
  - (iii) bremsstrahlung photons produced by the  $\pi^-$  will also pair produce
- ▶ forward-pointing “hadronic flashlight” that has discrete jumps in  $dE/dx$  and no hadronic activity from interaction vertex

## Summary

- ▶ The production of charged-meson resonances in  $\bar{\nu}_e - e$  scattering is an interesting and previously inaccessible SM neutrino reaction

## Summary

- ▶ The production of charged-meson resonances in  $\bar{\nu}_e - e$  scattering is an interesting and previously inaccessible SM neutrino reaction
- ▶ We estimate  $\mathcal{O}(100)$   $\rho^-$  meson resonance events at proposed FPF detectors

## Summary

- ▶ The production of charged-meson resonances in  $\bar{\nu}_e - e$  scattering is an interesting and previously inaccessible SM neutrino reaction
- ▶ We estimate  $\mathcal{O}(100)$   $\rho^-$  meson resonance events at proposed FPF detectors
- ▶ Detection prospects at FLArE are promising? More ideas?
