Lorentzian Wetterich equations from the perturbative algebraic QFT perspective

Monday 23 September 2024 12:10 (40 minutes)

In this talk I will present recent results obtained in collaboration with d'Angelo, Drago and Pinamonti. We proposed a new formulation of renormalisation group flow equations that work on arbitrary globally hyperbolic spacetimes and for any chosen Hadamard state. The examples treated so far include the scalar field, Yang-Mills theories and gravity.

Presenter: REJZNER, Kasia
