Riemann-Hilbert correspondence and wall-crossing structures

Tuesday 21 January 2025 09:30 (1 hour)

Generalized Riemann-Hilbert correspondence proposed by Maxim Kontsevich and myself in 2015 relates two areas of mathematics: deformation quantization and Floer theory. The aim of my talk is to revisit various aspects of the generalized RH-correspondence. In particular I am going to explain how wall-crossing structures relate local and global versions of the RH-correspondence.

Presenter: SOIBELMAN, Yan
