

CHIPP Plenary meeting 2024

June 20, 2024

Ben Kilminster (CHIPP chair)

Time of the meeting: 20 June 2023 at 14h00

Indico link <https://indico.cern.ch/event/1395037/>

1. Welcome, news from CHIPP Board and Executive Board
Kilminster

2. CHIPP Elections

- **two Plenary-ECFA representative**
- **ACCU Swiss representative**

REPORTS:

Agenda approved ?

Minutes of the last meeting

Material/Minutes of the CHIPP Plenary 2023 have been made available on www.chipp.ch

Agenda item 2: election of the Restricted ECFA member

The election of the Swiss representatives in the European Committee for Future Accelerators (ECFA) belongs to the CHIPP Plenary, based on a recommendation by the Board.

- The present Swiss representatives in ECFA are:

Rainer Wallny (ETHZ) Restricted ECFA and Plenary ECFA member until Dec 2026, 1st term

Sergio Gonzalez Sevilla (U.Ge) Plenary ECFA member until Dec 2027, 1st term

Philipp S. Wellenbug (PSI), Plenary ECFA member until Dec 2027, 2nd term

Annapaola De Cosa (ETHZ), Plenary ECFA member until Dec 2025, 1st term

Election of a a Restricted and Plenary ECFA member

The Plenary Board is invited to:

elect: Sergio Gonzalez Sevilla (UGe)

Plenary ECFA for a 1st three-year term (Jan. 2025 – Dec. 2027)

re-elect: Philipp S. Wellenburg (PSI)

Plenary ECFA for a 2nd three-year term (Jan. 2025 – Dec. 2027)

Agenda item 2: *Election of the Swiss representative to ACCU*

ACCU: Advisory Committee of CERN Users

The election of the Swiss representatives in ACCU belongs to the CHIPP Plenary, based on a recommendation by the Board. (Article 19, litt. e)

The plenary board is invited to re-elect:

Sergio Gonzales Sevilla (UniGE)

for a third two-year term from January 2025 to December 2026
as ACCU representative.

Required majority: simple

NEW CHIPP

Executive Board composition

The present composition of the CHIPP EB is the following:

Ben Kilminster CHAIR (Jan 2023 - Dec 2025)

Paolo Crivelli (Jan 2025 - Dec 2026)

Michael Spira (Jan 2025 - Dec 2026)

Tobias Golling (Jan 2024 - Dec 2025)

CHIPP Functions & Tasks elections

- CHIPP EB: **Kilminster, Crivelli** and **Spira** extended
- CHIPP Account Auditors **S. Schramm** extended
- Outreach/Education: **K. Müller** extended
- Plenary ECFA: **Sergio Gonzalez Sevilla** and **Philipp S. Wellenburg**
- ACCU: **Sergio Gonzalez Sevilla**
- ECT*: **Gilberto Colangelo**
- Computing Chair: **Mauro Donegà**
- CHAPS observer: **Martin Kunz**
- **ERC-ECFA**: **P. Kontaxakis (UGe)**, E. Niel (EPFL) & M. Pesut (UZH) & G. Lospalluto (PSI) extended
- CHIPP Winter School: **B. Penning**, L. Schutska

CHIPP is producing a 4-year roadmap for 2029-2032

- To be printed in December 2024

CHIPP is expected to provide input to the European strategy update for March 2025

- Will be based on roadmap

Board discussion items

- Feedback from Swiss RECFA visit (March)
- SNF long-term research infrastructures white paper
- CHEF (CH High-Energy physics for the FCC) proposed program
- Tier-2 computing report

CHIPP has discussed today (and approved?)

- new CHIPP postdoc prize starting 2025
- code of conduct for CHIPP web page

CHIPP Prize 2024

Gabriela Rodrigues Araujo

The CHIPP Prize jury honours Gabriela Rodrigues Araujo for her significant and novel contributions to a wide range of experimental techniques for the GERDA, LEGEND, MONUMENT and PALEOCCENE experiments in the field of neutrino physics and related measurements that enabled to set record-limits on the neutrinoless double beta decay and initiated innovative developments of experimental techniques.

CERN Council updates

Florencia Canelli

CERN Council Report – brief and most recent news

- **FCC feasibility study:** MidTerm report released in Feb 2023 → Final report to be completed in March 2025 (including financial funding planning)
- **Update of European strategy for Particle Physics:** Input from community by March 31, 2025, Summer Open Symposium June 23–27, 2025, Conclusion in June 2026
- **Experimental program in EC3N Facility:** Approval of SHiP proposal
- **CERN-US collaboration:** strong statement of intent on collaboration with CERN if FCC is approved
- **First private donor contribution to CERN project:** Next-Generation Triggers Project from Eric and Wendy Schmidt Fund (~\$50M)
- **Science Gateway:** 247 756 visitors (from CH 53764) since 8 October 2023 (day of opening to the public) [1 year of operation) > 350k visitors, before Science Gateway, CERN used to host ~ 150k visitors/year]
- **Russia-Ukraine war:** Waive the financial contribution of Ukraine to CERN for 2024 (and 2023, 2022), Termination of ICAs for Belorussia and Russia institutions from June and November 2024, respectively
- **Enlargement process:** Estonia new MS, Brazil new Associate MS (first from the Americas)
- **HL-LHC preparation:** following developments from Accelerator and status of upgrades of ATLAS/CMS detectors
- **CH at CERN:** Personnel and Financial Contributions for 2022 and 2023 in attachments
- **Topics coming up :** LHCb and ALICE upgrades for HL-LHC; selection of Council president, ESPPU secretary, and DG selection, review of Final FCC feasibility report

Florencia Canelli – UZH

ECFA ECR PANEL

Armin Ilg

ECFA ECR Panel composition and activities

*Members are, in general, **PhD students and postdocs, either with a non-permanent contract or with up to eight years after obtaining the PhD.** Up to **three members** (+1 for countries with LDG lab), among them at least one PhD student and one postdoc, can be nominated **by each ECFA country** represented in ECFA for a **mandate of two years, extendable for another two years.** Nominations are to be endorsed by Plenary ECFA. Members act as individuals, but should be able to represent the views of early-career researchers in particle physics in the nominating country.*

- From PhD students to young assistant professors
- Theoreticians, phenomenologists, experimentalists, ...

→ Diversity in cultural background, career and research, trying to represent the whole community

- 5 ECR delegates in Plenary ECFA, 1 delegate in Restricted ECFA, Organizing Committee

Switzerland has 3+1 representatives: Armin Ilg (UZH, *Plenary ECFA*), Giuseppe Lospalluto (PSI/ETHZ), Elisabeth Niel (EPFL), Marko Pesut (UZH, *Organizing Committee*)

- Armin Ilg reaching end of mandate end of 2024 → Replaced by Pantelis Kontaxakis (UniGe)

ECFA Early-Career Researcher Panel Update

- 09.2023: [Future Colliders for Early-Career Researchers](#) event at CERN
 - Report to be made public on arXiv soon
 - Blueprint for national events on future colliders for ECRs ([Zenodo](#))
 - First iterations in Nordic countries and Austria, want to organise similar event in CH
- 04.2024: ECFA ECR survey on career prospects and diversity in physics programme ([arXiv:2404.02074](#))
- 05.2024: Survey on training in ML and software (with similar report as output)
- Community interactions: EPS2023, ICFA seminar, ECFA newsletters, FCC Week 2024
- Report of our 2023 activities to be released soon!

Future Colliders for ECRs at CERN

CHAPS

Martin Kunz

CHAPS structure

- ❑ Philippe Jetzer (UZH) is SCFA president and CHAPS chair.
- ❑ [SSAA/SGAA](#) corresponds to CHIPP (but separate president: Margit Haberreiter, PMOD).
- ❑ [CHAPS](#) (tenured astronomy professors) ~ CHIPP Board
- ❑ [SCFA](#) (Swiss Commission for Astronomy, committee of SCNAT) ~ CHIPP Executive Board

CHAPS membership

- ❑ CHAPS members are (astronomy) professors with a permanent position in Switzerland. This includes titular professors but excludes, e.g., SNSF and ERC professors.
- ❑ A professor is in principle either a member of the CHIPP Board or of CHAPS, but not of both. (highlighting by Ben)

CHAPS activities

- ❑ CHAPS defines strategic priorities for the Astronomy Roadmap and FLARE funding (as CHIPP for PP).
- ❑ Swiss Astronomy Roadmap 2025 – 2028 (completed in 2022).
- ❑ Update situation unclear at meeting (but [SCNAT received mandate by SERI](#) at end of 2023 for update by end of 2024). Request to CHAPS members to join themes:
 - 1) Fundamental physics, 2) Origins: stars, galaxies and the evolving Universe, 3) Planets and search for extra-terrestrial life, and 4) Our home and its space environment.

Swiss Committee on Space Research (CSR)

CSR is a coordination body under SCNAT for space science

Coordinates and stimulates space research in Switzerland and maintains contact with international organisations

CSR president (currently Stéphane Paltani, UniGe) is the Swiss scientific representative to ESA's science program and COSPAR

Produces a report ("COSPAR Report") every two years on space science activities in Switzerland

Hot off the prese: COSPAR report 2022-2024: Space Research in Switzerland, available on CSR web page

Produces a roadmap on space science in Switzerland

Last version: **Roadmap Space Science in Switzerland 2019**, available on CSR web page

Update of the roadmap in progress

Switzerland does not have a space agency: ESA manages the Swiss participations in space missions, including non-ESA missions, through the ESA PRODEX program

The Swiss Space Office of SERI decides on the selection and funding of Swiss PRODEX projects

Successful Swiss participations in major missions launched in the past few years

CHEOPS (2019), Solar Orbiter (2020), JWST(2021), XRISM (2023), JUICE (2023), EUCLID (2023), ...

Current participations in missions that are planned to be launched in the coming years

SMILE (2024), IMAP (2024), POLAR-2 (2027), PLATO (2027), Comet Interceptor (2029), EnVision (2031), ARRAKHIS(2031), LISA (2035), ATHENA (2037), ...

Participation to mission proposals in various selection stages and potential (highly uncertain) launch dates

HERD (2027), LunPAN (2029), StrobeX (2032), THESEUS (2037), M-Matisse (2037), ...

CHIPP sciences/technologies are closely related to cosmology, gravitational wave, high energy astrophysics, x/γ/cosmic-ray missions

The long and risky selection and development process of space missions requires persistency and diversification!

OUTREACH/EDUCATION

Katharina Mueller

CHIPP – short outreach report, June 2024

High Schools & Students

- Masterclasses – at Bern, Geneva, EPFL and Zurich
- Workshops: Science Lab @ UZH, iLab @ PSI, Physiscope @ Geneva
- Visits at universities, CERN and schools (eg PhD students @ schools)
- Mentoring, workshops, internships, study programs for high-school students

Events

- Women and girls in science, February 11: special programs for girls in science
- Women in Physics career event at SPS (mentoring project)
- Scientifica (Zurich), Science & Nature Festival (UZH)

General public

- (Virtual) visits, talks, guided tours, videos, Youtube,...
- CHIPP members very active in (VIP) visits at CERN and inauguration of the Science Gateway
- CHIPP articles
- Science Pavilion UZH: exhibitions (LHC & Dark Matter, GW)
well attended guided tours for schools, groups and general public
- Interviews, articles in newspapers

for extended report, see CHIPP agenda ideas/suggestions?

→ Katharina (kmuller@physik.uzh.ch)

2024: 70th anniversary of CERN, SPS event 10 September with talk, panel discussion and apero

Swiss coordination: Hans Peter Beck

[New set of posters on CERN and Swiss contributions](#) for SPS (Show them locally if there is an opportunity)

Proton-Proton Collisions @ LHC
ATLAS, CMS & LHCb

70 years of Swiss Science at CERN

The Large Hadron Collider, LHC (start 2009)
The LHC is designed to study the origin of electroweak symmetry breaking, to search for New Physics beyond the Standard Model and to perform precision measurements to test the Standard Model. ATLAS and CMS jointly discovered the Higgs boson in 2012, leading to the 2013 Nobel Prize in Physics. Swiss groups have been involved in the ATLAS, CMS and LHCb projects since the mid-1990s with essential contributions to hardware, computing and physics analyses. Switzerland operates a Tier-2 computing centre at the Swiss National Supercomputing Centre (SCCS) in Lugano.

ATLAS	CMS	LHCb

Neutrinos @ CERN
OPERA : Neutrino Oscillations

70 years of Swiss Science at CERN

First observation of neutrino oscillations	Emulsion scanning station	Swiss contributions
<p>OPERA (2008-2012) is unique in studying neutrino oscillations by searching for appearance of the muon neutrino in the CERN muon-neutrino beam to Gran Sasso. This hybrid detector has a 1500 ton target mass composed of emulsion film-based sandwiches complemented by electronic detectors.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> Experiment proposal, design and construction Management, Supervision Target fabrication Development and validation of automatic microscopes Data taking and coordination Mass emulsion scanning Physics data extraction Detector search procedures Model ID & Neutrino Measurement Neutrino Transport Identification Electron-neutrino and $\bar{\nu}_e$ identification Characterization of neutrino events Appearance-rejection studies $\nu_e \rightarrow \nu_\mu$ oscillation analysis $\bar{\nu}_e \rightarrow \bar{\nu}_\mu$ oscillation analysis 	<p>The detection principle of OPERA. Signal is the presence and absence of the alpha track 'hit' by the muon. The detection principle is based on the detection of the alpha track 'hit' by the muon.</p> <p>Swiss groups have a leading role in the realization of the emulsion Emulsion Scanning System: beam characterization, emulsion scanning, and automated handling of the emulsion films.</p>	<p>Swiss contributions to:</p> <ul style="list-style-type: none"> Experiment proposal, design and construction Management, Supervision Target fabrication Development and validation of automatic microscopes Data taking and coordination Mass emulsion scanning Physics data extraction Detector search procedures Model ID & Neutrino Measurement Neutrino Transport Identification Electron-neutrino and $\bar{\nu}_e$ identification Characterization of neutrino events Appearance-rejection studies $\nu_e \rightarrow \nu_\mu$ oscillation analysis $\bar{\nu}_e \rightarrow \bar{\nu}_\mu$ oscillation analysis

Neutrinos @ CERN
Neutrino Oscillations - NOMAD

70 years of Swiss Science at CERN

Neutrino Oscillations - NOMAD
<p>In the 1990s it was observed that only about half of the expected flux of muon neutrinos produced in the Sun arrives on Earth – the solar neutrino problem. A possible explanation was that the three neutrino species oscillate from one to the other with a frequency which depends on their difference in mass squared.</p> <p>NOMAD (1995-1998) was an experiment searching for $\nu_e \rightarrow \nu_\mu$ oscillations at the CERN SPIS muon-neutrino beam in a short baseline experiment. Theoretical arguments suggested at that time that the tau-neutrinos have a mass of 1 eV/c² or higher and oscillating over short distances into muon-neutrinos.</p> <p>The experiment was located in the CERN West Hall. It is composed of drift chambers (the target), a transition radiation detector, an electromagnetic calorimeter installed inside a magnet providing a field of 4 T. The muon detectors are located outside the magnet. Kinematic criteria were used to distinguish muon from tau neutrinos. No evidence for oscillations was found.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> Experiment proposal, design and construction Management, Supervision Target fabrication Development and validation of automatic microscopes Data taking and coordination Mass emulsion scanning Physics data extraction Detector search procedures Model ID & Neutrino Measurement Neutrino Transport Identification Electron-neutrino and $\bar{\nu}_e$ identification Characterization of neutrino events Appearance-rejection studies $\nu_e \rightarrow \nu_\mu$ oscillation analysis $\bar{\nu}_e \rightarrow \bar{\nu}_\mu$ oscillation analysis

Fixed Target Programme @ SP5
Hyperon and Drell-Yan Experiments

70 years of Swiss Science at CERN

SP5 - Super Proton Synchrotron: 7 km circumference, 1976
<p>The 400 GeV proton beam of the SP5, was extracted and used to produce secondary beams for fixed-target experiments located in the west (WA) and north areas (NA). Swiss groups were involved in several WA experiments operating with charged hyperon beams between 1976 and 1982, as well as NA experiments operating with intense positron beams between 1980 and 1985. Starting in 1981, the SP5 was also operated in proton-antiproton collider mode for experiments in the Underground Area (UA) leading to the discovery of the W and Z bosons in 1983.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> WA2, WA46 WA42, WA62 NA10 - Drell-Yan NA16

Fixed Target Programme @ PS
DIRAC & CLOUD

70 years of Swiss Science at CERN

Proton Synchrotron (PS): 628 m circumference, 1959	DIRAC - Dimension Relativistic Atom Complex	CLOUD: Cosmic Rays, 2009
<p>The 26 GeV Proton Synchrotron was CERN's first synchrotron, accelerating protons first time on 24 November 1959, and was for a brief period the world's highest energy particle accelerator. Ever since, the PS has accelerated protons, alpha particles, oxygen, sulphur and lead nuclei, electrons, positrons and antiprotons. Today, the PS supplies protons and lead ions in the ion-injector chain for the LHC. The PS also supplies protons to a target where antiprotons are generated for the Antiproton Decelerator. The DIRAC and CLOUD experiments use proton beams from the PS and are situated in the CERN East Hall, located adjacent to the PS.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> DIRAC CLOUD 	<p>DIRAC is an experiment that measures Hydrogen-like atoms consisting of a charged meson pair at the PS. Dimensions, such as the r^* (A_1) and the r^* atom (A_2) - provide a unique tool for exploring low-energy hadron-hadron interactions and understand the strong force.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> DIRAC 	<p>The CLOUD project investigates the possible influence of galactic cosmic rays on the aerosol-cloud-climate interaction. The PS is used to produce protons to simulate atmospheric ionization conditions from ground level to the upper free troposphere. The 27 m cloud chamber allows to precisely control experiments with a very low contamination background and close to atmospheric conditions.</p> <p>Swiss contributions to:</p> <ul style="list-style-type: none"> CLOUD

Proton-Antiproton Collisions @ SppS
UA2 & UA6 Experiments

70 years of Swiss Science at CERN

SppS – the SPS converted in a proton-antiproton collider
In order to study strong and electroweak interactions for the first time in the energy domain around 100 GeV, the SPS was converted in a risky way into a proton-antiproton collider in the 1980s. The injection of electrostatically cooled antiprotons into the SPS and their acceleration to 270 GeV opened up the possibility to study proton-antiproton collisions at the centre-of-mass energy of 540 GeV. The primary experimental goal was to search for the massive intermediate vector bosons W and Z, postulated in 1967 in the unified electroweak theory.

UA2 experiment (1981-1990)
UA2 was built around the Bevatron pipe, a hadron-electromagnetic and nuclear calorimeter to detect electrons and hadrons, but could not measure particle charges except for limited regions where the UA2 decay asymmetry was measured. There was no muon detector.

UA6 experiment (1984-1990)
UA6 was a fixed-target experiment installed at the SPS. A jet of hydrogen molecules (H₂) was injected in the beam-pipe, colliding with protons and antiprotons in opposite directions at a centre-of-mass energy of 24.3 GeV and an instantaneous luminosity of 10³¹ cm⁻²s⁻¹.
The experiment was instrumented with a hadron-magnetic spectrometer equipped with multiwire proportional chambers, an electromagnetic calorimeter, and a neutrino detection detector. The Lousener group built several MINIVACS, contributed to the design and construction of the muon veto target, and also tested the "transparent" technology to implement the trigger logic.

1992: First evidence for high transverse momentum hadronic jets, confirming the 2-jet production dominance.
1983: Discovery of W, Z.

Particle Physics in Space
AMS 01 & 02
Measuring Charged Cosmic Rays

70 years of Swiss Science at CERN

Alpha Magnetic Spectrometer (AMS) for the International Space Station (ISS)
AMS is a complex particle physics detector installed at the ISS to measure the components of charged cosmic rays with unprecedented precision. AMS-01 was a prototype detector in the Space Shuttle mission STS-87 (1998). In 2011 the highly improved AMS-02 was installed on the ISS and is successfully taking data now. It is planned to take data as long as the ISS is operational. The AMS-02 detector contains a silicon radiation detector, nine planes of silicon trackers, surrounded by an array of 16 anti-coincidence counters, an electromagnetic calorimeter, a time of flight detector with superpixels of scintillating padshells and a ring-style Cherenkov detector to measure and identify charged particles.

The majority of the silicon detectors for the AMS-01 and AMS-02 trackers were produced by University of Geneva and ETH. ETHZ also contributed the high precision support structure for the AMS-01 Tracker. This was later modified by University of Geneva for AMS-02.
The feed-in permanent magnet for AMS-01 was measured by ETHZ. Originally, a superconducting magnet was built for AMS-02 where ETHZ contributed the superconducting coils and worked on the cryogenic electronics. When it was decided to significantly reduce the AMS-02 operation time, it was necessary to switch back to the permanent magnet.
While AMS-01 was assembled at ETHZ, AMS-02 was assembled at CERN.
CERN also hosts the main operation center for AMS-02.

Assembly of AMS-01 at ETHZ, AMS-02 at CERN, Space Shuttle.

Fixed Target Programme @ SPS (Heavy Ions)
NA52 (NEWMASS) & WA98

70 years of Swiss Science at CERN

1990s: SPS: heavy ion fixed target program searching for:
• PbPb collisions
• Hot and dense state of matter
• Quark-gluon plasma (QGP)
• Switzerland contributed to NA52 and WA98

NA52 Searches for Stranglets: bound states involving strange quarks in the COP

• 524 m long spectrometer, solid angle acceptance 2.2 pr
• 32 Pb beams in the massive North Area
• Results: 10¹¹ Pb-Pb collisions
• matter and antinuclei (anti-helium-3) production
• confirmation of the COP
• no evidence for Stranglets

WA98 Large Acceptance Proton and Neutron Spectrometer
• High precision study of strange, multi-strange and charged particles, and their correlations
• "PANDA" had detector to measure multiplicities and moments of particles and heavier fragments
• Two spectrometers: muon momentum
• Lead-Glass spectrometer with 10,000 modules for high precision dets on n⁺ and n⁻
• 40000

1998: First evidence for high transverse momentum hadronic jets, confirming the 2-jet production dominance.
1983: Discovery of W, Z.

Future Accelerators – The energy frontier
CLIC, HL-LHC, FCC

70 years of Swiss Science at CERN

Future Accelerators at CERN
The Swiss accelerator community has been contributing to the development of CERN accelerators. Among these are the LHC complex, the HL-LHC upgrade and studies for the Compact Linear Collider (CLIC) and the Future Circular Collider (FCC).

CLIC studies have been supported by both the Paul Scherrer Institute and EPFL. Contributions have been made in the following areas:
• The development of high gradient and beam stabilization structures.
• The Laboratory of Particle Accelerator Physics at EPFL in collaboration with the CERN Accelerator Program supports studies for the HL-LHC upgrade and studies for the Compact Linear Collider (CLIC) and the Future Circular Collider (FCC).
• EPFL and EPFL, with its long experience and energy efficient High-temperature superconducting magnet technology for FCC-ee.
• ETH is developing tracking detectors and algorithms for the FCC-ee.
• UCLouvain is developing tracking detectors and algorithms for the FCC-ee.
• EPFL and EPFL, with its long experience and energy efficient High-temperature superconducting magnet technology for FCC-ee.
• ETH is developing tracking detectors and algorithms for the FCC-ee.
• UCLouvain is developing tracking detectors and algorithms for the FCC-ee.

Politics & Public
Early Days of CERN

70 years of Swiss Science at CERN

Timeline
• Two AND-2 conferences (December 1951: Physics and Chemistry; 1952: Chemistry of Matter) and the CERN Convention (1953) led to the creation of the European Organization for Nuclear Research (CERN) in 1954.
• The three original member states (Belgium, France, and the UK) were joined by Switzerland in 1959.
• In 1958, the CERN Convention was signed, and the CERN was officially born. A small team of physicists and engineers started to work on the first accelerator.
• In 1960, the first accelerator (the Proton Synchrotron) was put into operation.
• In 1961, the first accelerator (the Proton Synchrotron) was put into operation.

CERN and the region
CERN and the region have a long history of cooperation. The CERN Convention was signed in 1953, and the CERN was officially born. A small team of physicists and engineers started to work on the first accelerator. In 1960, the first accelerator (the Proton Synchrotron) was put into operation. In 1961, the first accelerator (the Proton Synchrotron) was put into operation.

Antiproton Decelerator
Antihydrogen :
ATHENA, AegIS, ALPHA-g & GBAR

70 years of Swiss Science at CERN

There continues Swiss contribution to the world-wide Antiproton Factory at CERN which produces low energy antiprotons for precision studies on antihydrogen. GeV antiprotons from a production target are cooled to about 50 MeV in the AD ring. The antiprotons are then cooled down to 100 MeV in the new ELENA facility (CERN Low Energy Antiproton Ring). Beam electrons for precision studies are antihydrogen atoms, which are synthesized at several experiments at the lowest possible energies.

ATHENA (2002-2005)
Antihydrogen production on the AD ring.
• ATHENA: study the feasibility of producing antihydrogen on the AD ring.
• ATHENA: study the feasibility of producing antihydrogen on the AD ring.
• ATHENA: study the feasibility of producing antihydrogen on the AD ring.

AegIS (since 2012)
Antihydrogen production on the AD ring.
• AegIS: precision study of the antihydrogen ground state.
• AegIS: precision study of the antihydrogen ground state.
• AegIS: precision study of the antihydrogen ground state.

GBAR
Gravitational free-fall of antihydrogen.
• GBAR: precision study of the antihydrogen ground state.
• GBAR: precision study of the antihydrogen ground state.
• GBAR: precision study of the antihydrogen ground state.

ATHENA: precision study of the antihydrogen ground state. AegIS: precision study of the antihydrogen ground state. ALPHA-g: precision study of the antihydrogen ground state. GBAR: precision study of the antihydrogen ground state.

Early Detectors
From Bubble to Wire Chambers

70 years of Swiss Science at CERN

In the 1950s and 1960s, experimental particle physics made the transition to compact transistorized electronics for detector readout, allowing the speed and number of channels to increase. Today, an LHC experiment acquires information from millions of channels every 25 ns and billions of events are recorded instead of 0.1/100 events for a typical bubble chamber experiment.

Bubble Chambers
give a beautiful representation of particles. They were invented by D.A. Goswami in 1952 (based on 1902: advanced particle waves -100 to 100000) that are registered by optical cameras on films. The images are projected on tables and "digitized" by visual inspection and semi-automatically recorded on data cards or paper tape.

Multi Wire Proportional Chambers (MWPCs)
In 1960, CERN (based 1952) presented a new detector concept: the charged particle (TP) senses the gas in the region between cathode planes (CP). The signal is collected on anode wires (AW) and sent to amplifiers (A) and pulse shapers. The signal can be then digitized and stored. In general two MWPCs with orthogonal views are used to provide the CP-TP position.

Specialized Experiments

70 years of Swiss Science at CERN

With an expanding interest in undiscovered particles – particularly long-lived and dark matter particles – and the properties of neutrinos new specialized experiments have been proposed to expand the scientific program of CERN's accelerator complex and infrastructure. While FABER and SNO@CERN are located at the LHC, NA62 and NA61 use the beams of SPS. Swiss institutes contribute significantly to the detector's design and construction, readout, trigger, data acquisition and data analysis.

FASER & SND@LHC
FASER is a fixed target experiment searching for LLPs from the dark sector. It is designed and optimized to search for extremely long-lived particles in the LHC region, and will be located at a new SPS Beam Dump Facility at CERN.
SND@LHC is a fixed target experiment to study rare beam decays and the dark sector. It is designed and optimized to search for extremely long-lived particles in the LHC region, and will be located at a new SPS Beam Dump Facility at CERN.

NA62
NA62 is a fixed target experiment to study rare beam decays and the dark sector. It is designed and optimized to search for extremely long-lived particles in the LHC region, and will be located at a new SPS Beam Dump Facility at CERN.

SHP
SHP (Search for Hidden Particles) is a future experiment that searches for new weakly interacting particles. It is designed and optimized to search for extremely long-lived particles in the LHC region, and will be located at a new SPS Beam Dump Facility at CERN.

FASER: precision study of the antihydrogen ground state. SND@LHC: precision study of the antihydrogen ground state. NA62: precision study of the antihydrogen ground state. SHP: precision study of the antihydrogen ground state.

ACCU

Sergio Gonzalez

ACCU report (2024)

- **CERN news**

- ▶ 2024 LHC run extended by ~1 month until end of Nov. 2024
- ▶ CERN to terminate its International Collaboration Agreement with Russia and Belarus at their current expiry dates (Nov.2024 and June 2024, respectively)
- ▶ Mid-term review of the FCC feasibility study completed, concluding the best option is a 90.7 km tunnel at an average depth of 200 m.
- ▶ Science Gateway opened to public in Oct. 2023 and events linked to CERN's 70th anniversary planned for Sep / Oct 2024.

- **IT**

- ▶ 2FA authentication to be used by all users
- ▶ End-of life of Windows 10 in Q4 2025 (check your hardware compatibility !)
- ▶ New Google workspace for professional projects

- For more detailed information (including various useful links), please check the ACCU detailed report attached to this meeting agenda.

- I'd like to re-iterate my usual encouragement for Swiss users at CERN to contact me with your questions / requests that may matter for you and I'll brought them at the next ACCU meetings, thanks !

ECT*

Update on the (CH participation to the) ECT*

CHPP Board 2024-02
Gilberto Colangelo

Zoom-CH, 20.6.2024

1

ECT* mission

- ✓ to be a Centre at the frontline of research in theoretical nuclear physics
- ✓ to promote active contacts between theory and experiments, and to related areas of research
- ✓ to further the training of young researchers

- established in 1993
- Institutional member of ESF-Expert Committee NuPECC (Nuclear Physics European Collaboration Committee)
- community-driven, bottom-up approach

News 2023/24

ECT* celebrated its 30th anniversary in 2023

- **In 2023 it underwent a full review by an external committee with very positive outcome (available upon request)**

Sonia Bacca (Mainz), Barbara Erazmus (Nantes), Richard Hall-Wilton (FBK), **Maria Paola Lombardo** (INFN) Piotr Magierski (Warsaw), Ulf-G. Meißner (Bonn), Sanjay Reddy (Seattle)

- **The interim Director, Gert Aarts, ended his mandate and a new one has been nominated Ubirajara van Kolck (Orsay)**
- **Most MoUs have to be renewed, ours too**
- **I have been nominated to the scientific board starting 2024**

CHIPP decision/recommendation on the new MoU

- **Confirm Swiss support to the ECT***
- **Recommend to SNF to renew the MoU**
- **Recommend to increase financial support from 10 → 20 kCHF**

APPEC

Teresa Montaruli

APPEC short report

- This report concerns the General Assembly 05.06.2024 (next one Dec. 4-5, 2024)
 - The SAC is mandated to prepare the New Roadmap that will cover from 2027-2036.
 - Newly elected SAC Chair: Aldo Ianni (LNGS, ex-director of the lab), Deputy: M. De Nerois
 - At this GA election of Chair of GA (CH excluded from vote due to a technical delay in the signature of the new APPEC MoU): Carlos Peña Garay (director of Canfranc lab); General Secretary: Julie Epas.
 - Main task is the participation to the European Particle Physics Strategy Update launched by CERN in March 2024. In the EPPSU the APPEC GA Chair is invited as observer. Physics Preparatory Group tasked with Briefing Book preparation by Sept. 2025. Deadline submission for the contributions in March 2025, Drafting session Dec. 2025, approval by CERN Council June 2026
 - Preparation of JENAS 2025 in RAL (see JENAS Expressions of Interest on DM, GWs, ML optimised design of experiments, Nuclear physics at LHC and Search of Charged Particle Electric Dipole Moments in this [link](#))
 - List of WGs of Interest for the white paper on computing in

- HPC: https://indico.scc.kit.edu/e/JENA_computing_wp1/
 - Software: https://indico.scc.kit.edu/e/JENA_computing_wp2/
 - Data Management: https://indico.scc.kit.edu/e/JENA_computing_wp3/
 - ML & AI: https://indico.scc.kit.edu/e/JENA_computing_wp4/
 - Training: https://indico.scc.kit.edu/e/JENA_computing_wp5/

Expression of Interests (Eoi)

1. Dark Matter - iDMEu (<https://indico.cern.ch/event/869195/overview>)
2. Gravitational Waves for fundamental physics (<https://agenda.infn.it/event/22>)
3. Machine-Learning Optimized Design of Experiments - MODE (<https://mode->)
4. Nuclear Physics at the LHC (<https://indico.ph.tum.de/event/4492/>)
5. EDM - Search of Charged-Particle Electric Dipole Moments (<https://indico.p>)

T. Montaruli, CHIPP meeting, June 20, 2024

Outcomes of P5-HEPAP meeting 9-10 May 2024

Highest Priorities: complete construction of HL-LHC, the first phase of DUNE, PIP-II accelerator at FermiLab, the Rubin Observatory to carry out the legacy survey LSST and the LSST Dark Energy Science Collaboration.

Construct a portfolio of experiments for fundamental constituents of the universe and their interactions (also in the range of APPEC):

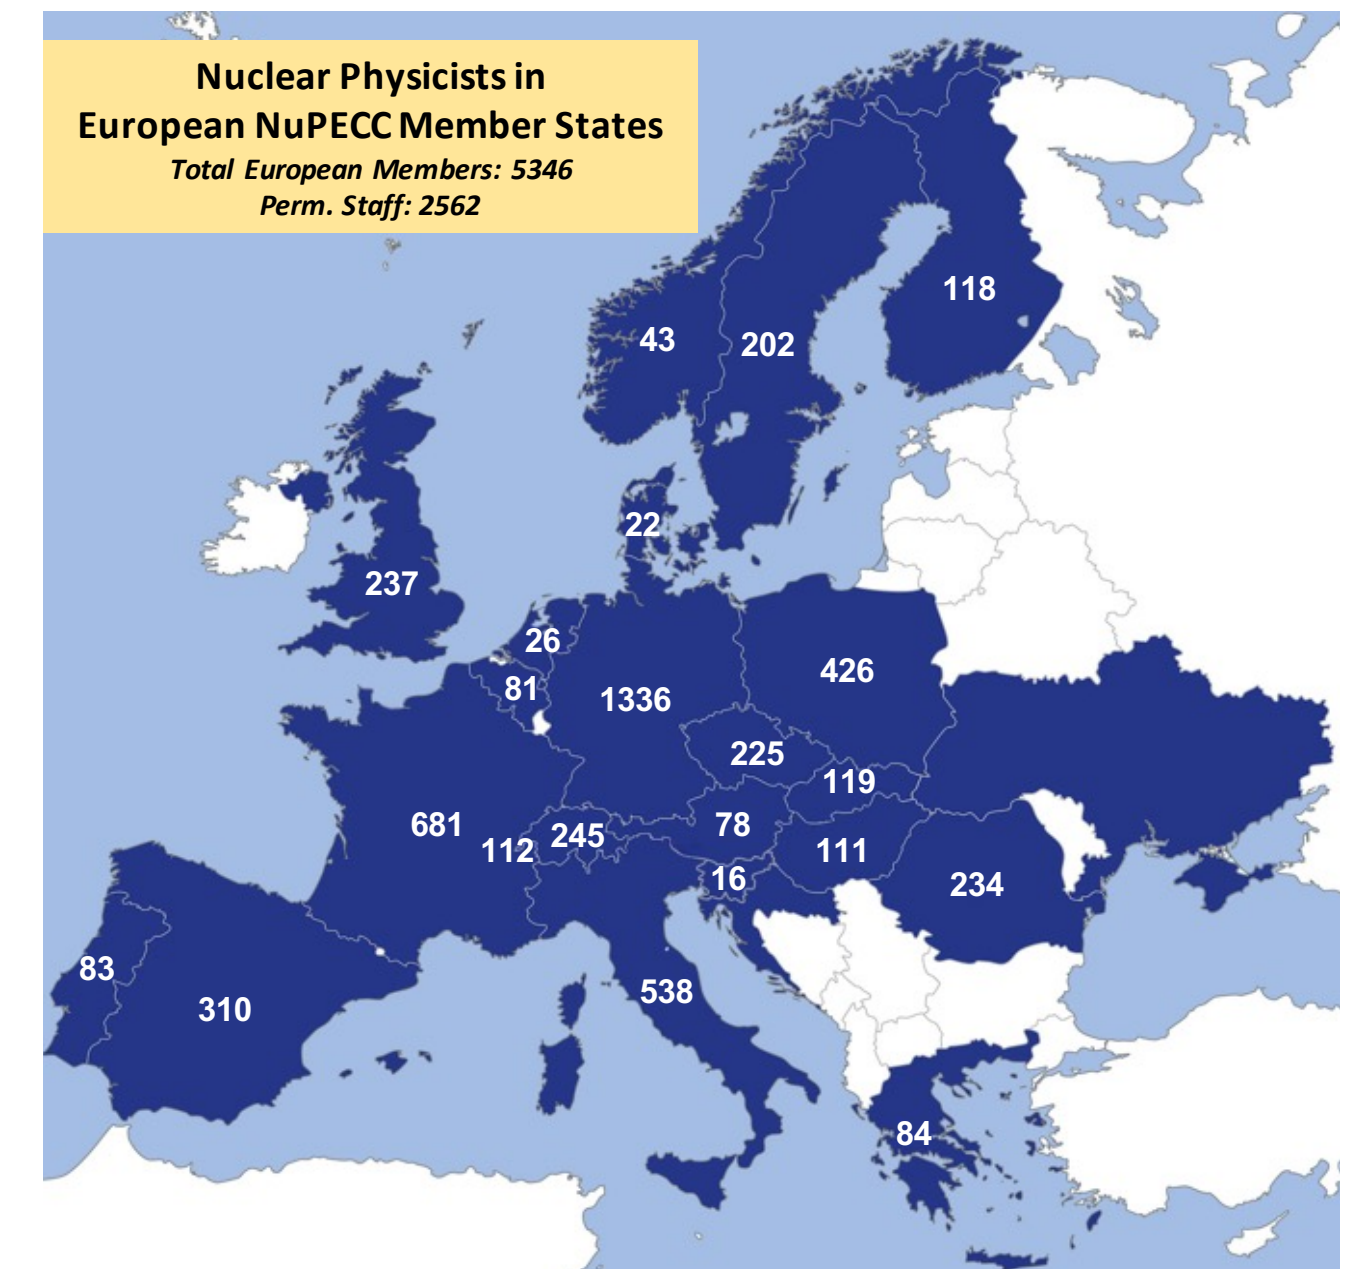

- CMB-S4 : NSF prioritises infrastructure in Antarctica necessary to maintain operations. DOE may fund projects not in Antarctica (no go for South Pole Telescope)
- G3 of DM direct detection: 2 proposals for G3 XLZD and ARGO - DOE is supportive of development of off-shore concepts.
- IceCube-Gen2.

NUPECC

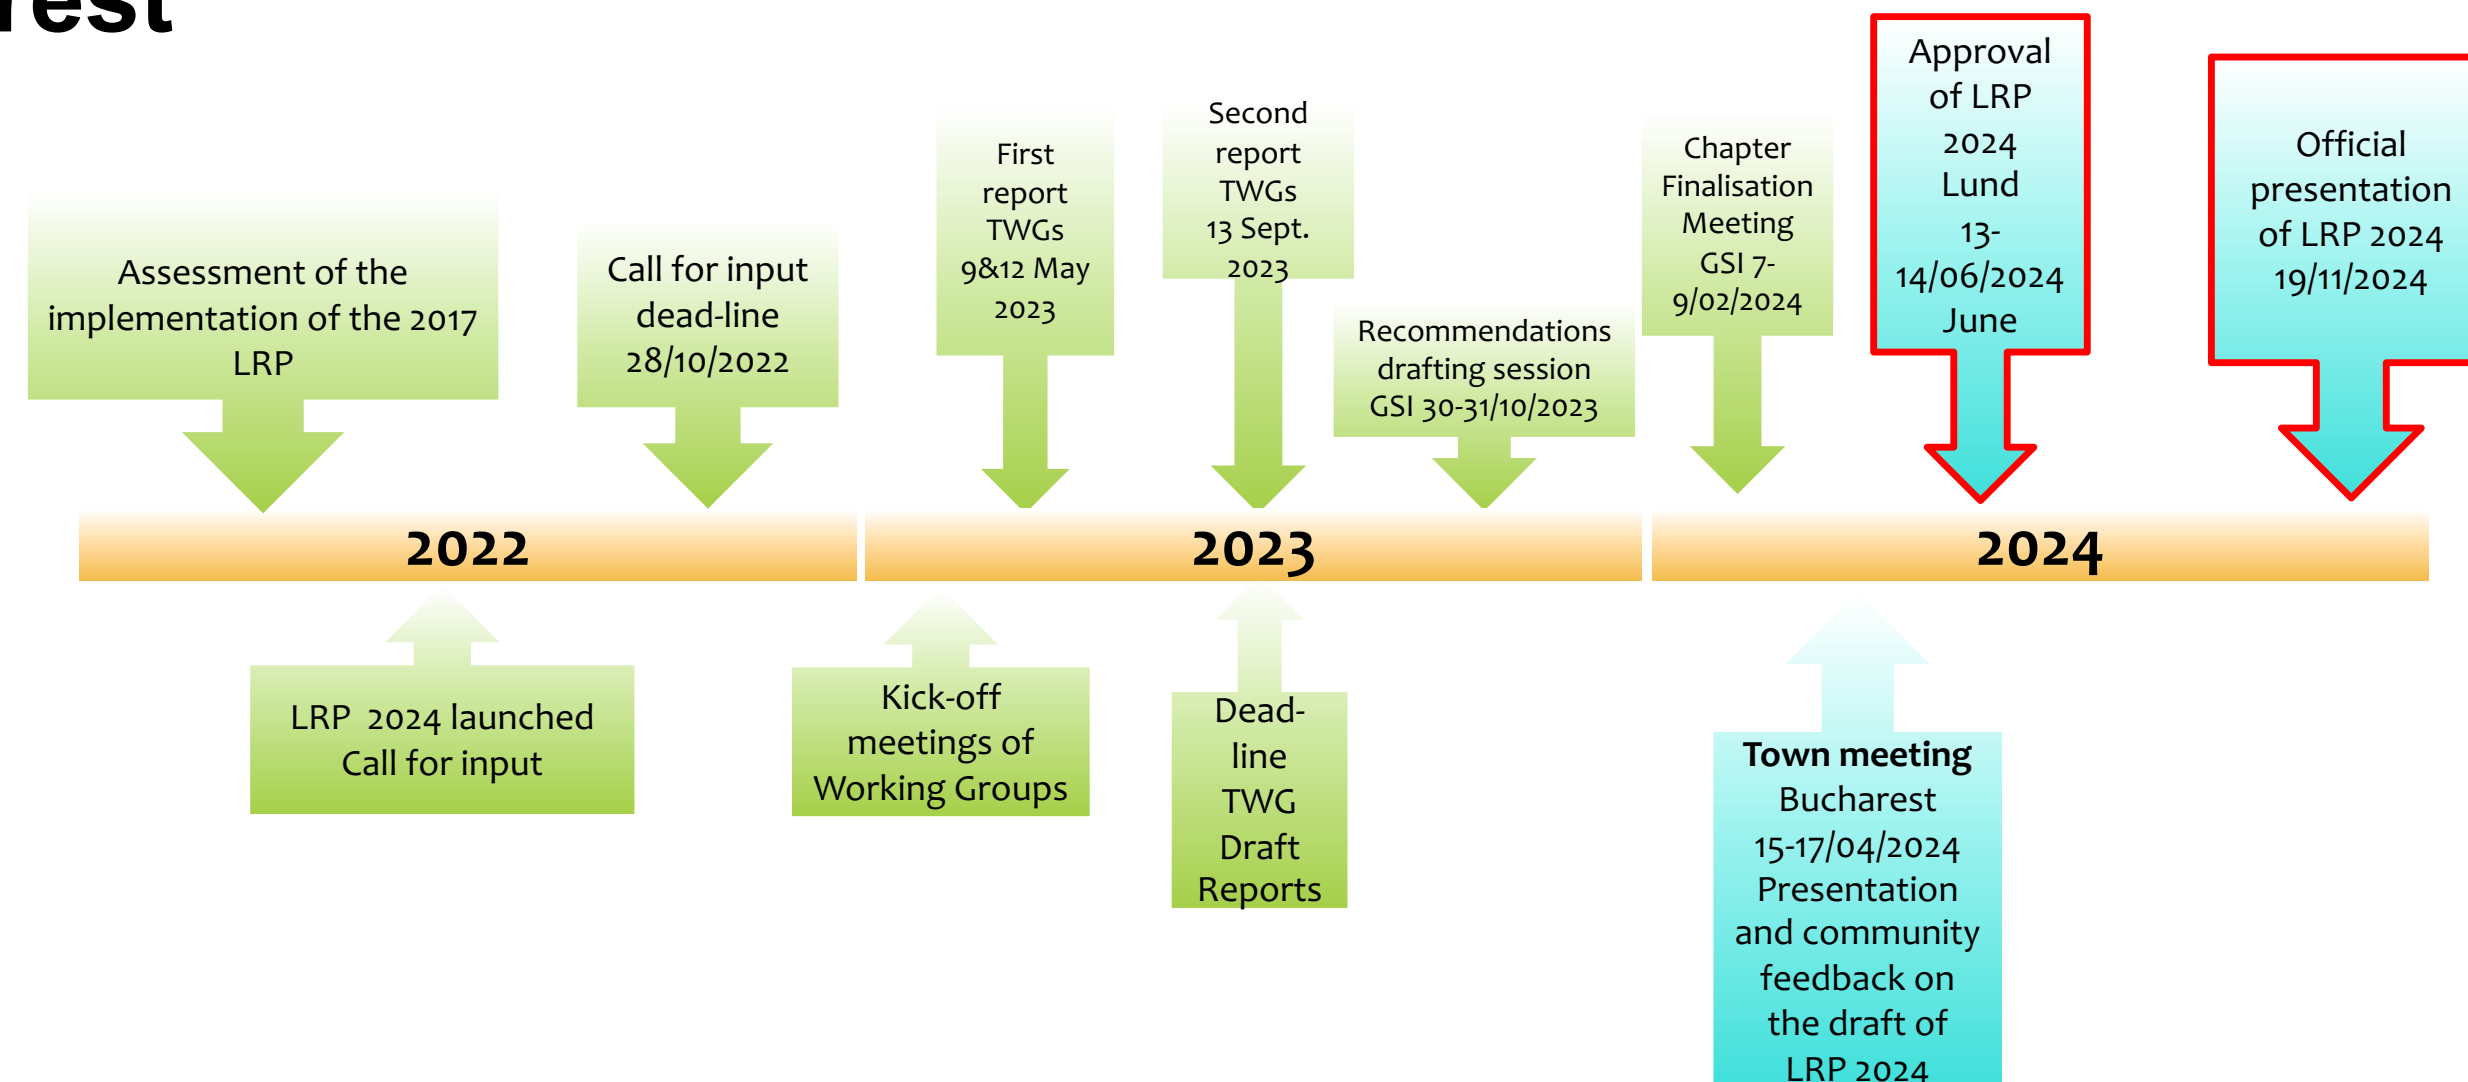

Nuclear Physics European Collaboration Committee (NuPECC)
Is the European Expert Board for Nuclear Physics hosted by European Science Foundation

In June 2022, NuPECC launched the call for input for the Long Range Plan 2024 (LRP2024). The work was split among 10 thematic working groups with the goal to identify opportunities and priorities for nuclear science in Europe.

The draft of the LRP2024 was presented to the Community at the Town Meeting 15-17 April 2024 in Bucharest

The official LRP2024 presentation will be on the 19.11.2024 in Brussels

<https://indico.ph.tum.de/event/7598/timetable/?view=nicecompact>

Gravitational Waves WG

Steven Schramm

Updates on GW in Switzerland

New Swiss hires:

- UZH (CHIPP): recently hired M. Soares-Santos, who started 01/2024
- ETHZ (CHIPP): hiring process at an advanced stage
- UniGe (CHAPS): stabilisation of A. Fragkos expected to be finalised next week
- UniGe (CHIPP): proposed stabilisation of S. Schramm, pending confirmation late 2024

Swiss community activities:

- GW-Learn Sinergia project has started (09/2023): brings together ET, LISA, ML, and theory
- Organised first GW session at SPS in 2023; currently organising second edition for 2024

Swiss research activities:

- ET: Switzerland continues to play a leading role at many different levels
 - Science and computing leadership already well established
- Virgo: T. Fragkos and S. Schramm are actively discussing Swiss participation in Virgo
 - Computing architecture evolutions for the future of ground-based GW observatories
 - Developing key DAQ infrastructure for Virgo and ET (collaboration with Annecy)
 - Virgo is an important milestone for Switzerland to build expertise in preparation for ET
